(54) Title: ANTISENSE MODULATION OF SURVIVIN EXPRESSION

(57) Abstract: Antisense compounds, compositions and methods are provided for modulating the expression of Survivin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targeted to nucleic acids encoding Survivin. Methods of using these compounds for modulation of Survivin expression and for treatment of diseases associated with expression of Survivin are provided.

1

ANTISENSE MODULATION OF SURVIVIN EXPRESSION

FIELD OF THE INVENTION

The present invention provides compositions and methods for modulating the expression of Survivin. In particular, this invention relates to antisense compounds, particularly oligonucleotides, specifically hybridizable with nucleic acids encoding human Survivin. Such oligonucleotides have been shown to modulate the expression of Survivin.

10 BACKGROUND OF THE INVENTION

A hallmark feature of cancerous cells is uncontrolled Among the differences that have been proliferation. discovered between tumor and normal cells is resistance to the process of programmed cell death, also known as apoptosis 15 (Ambrosini et al., Nat. Med., 1997, 3, 917-921). Apoptosis is a process multicellular organisms have evolved to prevent uncontrolled cell proliferation as well as to eliminate cells that have become sick, deleterious, or are no longer The process of apoptosis involves a multistep necessary. 20 cascade in which cells are degraded from within through the concerted action of proteolytic enzymes and DNA endonucleases, resulting in the formation of apoptotic bodies that are then removed by scavenger cells. Research to date has shown that much of the intracellular degradation is carried out through 25 the action of the caspases, a family of proteolytic enzymes adjacent to aspartate residues that cleave Biochemistry Journal, 1997, 326, 1-16).

2

The finding that most tumor cells display resistance to the apoptotic process has led to the view that therapeutic strategies aimed at attenuating the resistance of tumor cells to apoptosis could represent a novel means to halt the spread 5 of neoplastic cells (Ambrosini et al., Nat. Med., 1997, 3, 917-921). One of the mechanisms through which tumor cells are believed to acquire resistance to apoptosis by overexpression of Survivin, a recently described member of the IAP (inhibitor of apoptosis) caspase inhibitor family. 10 date, overexpression of Survivin has been detected in tumors of the lung, colon, pancreas, prostate, breast, stomach, non-Hodgkin's lymphoma, and neuroblastoma (Adida et al., Lancet, 1998, 351, 882-883; Ambrosini et al., Nat. Med., 1997, 3, 917-921; Lu et al., Cancer Res., 1998, 58, 1808-1812). 15 detailed analysis has been performed in neuroblastoma where it was found that Survivin overexpression segregated with tumor histologies known to associate with poor prognosis (Adida et al., Lancet, 1998, 351, 882-883). Finally, Ambrosini et al. describe transfection of HeLa cells with an 20 expression vector containing a 708 nt fragment of the human cDNA encoding effector cell protease receptor 1 (EPR-1), the coding sequence of which is extensively complementary to the coding strand of Survivin (Ambrosini et al., J. Bio. Chem., 1998, 273, 11177-11182) and which potentially acts as a 25 Survivin antisense RNA. This construct caused a reduction in cell viability. Methods for modulating apoptosis and for reducing the severity of a pathological state mediated by Survivin using agents that modulate amounts or activity of Survivin are disclosed in WO 98/22589, which also discloses 30 the EPR-1 coding strand/Survivin antisense construct described by Ambrosini et al., supra.

Survivin has recently been found to play a role in cell cycle regulation. It has been found to be expressed in the G2/M phase of the cell cycle in a cycle-regulated manner, and

the mitotic spindle. associates with microtubules of Disruption of this interaction results in loss of Survivin's anti-apoptotic function and increased caspase-3 activity during mitosis. Caspase-3 is associated with apoptotic cell 5 death. It is therefore believed that Survivin may counteract a default induction of apoptosis in G2/M phase. It is believed that the overexpression of Survivin in cancer may overcome this apoptotic checkpoint, allowing undesired survival and division of cancerous cells. The Survivin antisense construct 10 described by Ambrosini above was found to downregulate endogenous Survivin in HeLa cells and to increase caspase-3dependent apoptosis in cells in G2/M phase. Li et al., Nature, 1998, 396, 580-584.

As a result of these advances in the understanding of 15 apoptosis and the role that Survivin expression is believed to play in conferring a growth advantage to a wide variety of tumor cell types, there is a great desire to provide compositions of matter which can modulate the expression of It is greatly desired to provide methods of Survivin. 20 diagnosis and detection of nucleic acids encoding Survivin in animals. It is also desired to provide methods of diagnosis and treatment of conditions arising from Survivin expression. In addition, improved research kits and reagents for detection and study of nucleic acids encoding Survivin are desired.

Currently, there are no known therapeutic agents which effectively inhibit the synthesis of Survivin. Consequently, there is a long-felt need for agents capable of effectively inhibiting Survivin expression in tumor cells. oligonucleotides against Survivin may therefore prove to be 30 uniquely useful in a number of therapeutic, diagnostic and research applications.

SUMMARY OF THE INVENTION

25

is directed to invention antisense The present compounds, particularly oligonucleotides, which are targeted

4

to a nucleic acid encoding Survivin, and which modulate the expression of Survivin. Pharmaceutical and other compositions comprising the antisense compounds of the invention are also provided. Further provided are methods of modulating the 5 expression of Survivin in cells or tissues comprising contacting said cells or tissues with one or more of the antisense compounds or compositions of the invention. Further provided are methods of treating an animal, particularly a human, suspected of having or being prone to a disease or 10 condition with associated expression of Survivin administering a therapeutically or prophylactically effective amount of one or more of the antisense compounds or compositions of the invention.

DETAILED DESCRIPTION OF THE INVENTION

15 The present invention employs oligomeric antisense compounds, particularly oligonucleotides, for use modulating the function of nucleic acid molecules encoding ultimately modulating the amount of Survivin Survivin, produced. This is accomplished by providing antisense 20 compounds which specifically hybridize with one or more nucleic acids encoding Survivin. As used herein, the terms "target nucleic acid" and "nucleic acid encoding Survivin" encompass DNA encoding Survivin, RNA (including pre-mRNA and mRNA) transcribed from such DNA, and also cDNA derived from 25 such RNA. The specific hybridization of an oligomeric compound with its target nucleic acid interferes with the normal function of the nucleic acid. This modulation of function of a target nucleic acid by compounds which specifically hybridize to it is generally referred to as. The functions of DNA to be interfered with include replication and transcription. The functions of RNA to be interfered with include all vital functions such as, for example, translocation of the RNA to the site of protein translation, translation of protein from the RNA, splicing of

the RNA to yield one or more mRNA species, and catalytic activity which may be engaged in or facilitated by the RNA. The overall effect of such interference with target nucleic acid function is modulation of the expression of Survivin.

5 In the context of the present invention, "modulation" means either an increase (stimulation) or a decrease (inhibition) in the expression of a gene. In the context of the present invention, inhibition is the preferred form of modulation of gene expression and mRNA is a preferred target.

It is preferred to target specific nucleic acids for 10 antisense. "Targeting" an antisense compound to a particular nucleic acid, in the context of this invention, is a multistep process. The process usually begins with the identification of a nucleic acid sequence whose function is to be modulated. 15 This may be, for example, a cellular gene (or mRNA transcribed from the gene) whose expression is associated with a particular disorder or disease state, or a nucleic acid molecule from an infectious agent. In the present invention, the target is a nucleic acid molecule encoding Survivin. 20 targeting process also includes determination of a site or sites within this gene for the antisense interaction to occur such that the desired effect, e.g., detection or modulation of expression of the protein, will result. Within the context of the present invention, a preferred intragenic site is the 25 region encompassing the translation initiation or termination codon of the open reading frame (ORF) of the gene. Since, as is known in the art, the translation initiation codon is typically 5'-AUG (in transcribed mRNA molecules; 5'-ATG in the corresponding DNA molecule), the translation initiation codon 30 is also referred to as the "AUG codon," the "start codon" or the "AUG start codon". A minority of genes have a translation initiation codon having the RNA sequence 5'-GUG, 5'-UUG or 5'-CUG, and 5'-AUA, 5'-ACG and 5'-CUG have been shown to Thus, the terms "translation initiation function in vivo. 35 codon" and "start codon" can encompass many codon sequences,

6

even though the initiator amino acid in each instance is typically methionine (in eukaryotes) or formylmethionine (in prokaryotes). It is also known in the art that eukaryotic and prokaryotic genes may have two or more alternative start codons, any one of which may be preferentially utilized for translation initiation in a particular cell type or tissue, or under a particular set of conditions. In the context of the invention, "start codon" and "translation initiation codon" refer to the codon or codons that are used in vivo to initiate translation of an mRNA molecule transcribed from a gene encoding Survivin, regardless of the sequence(s) of such codons.

is also known in the art that a translation termination codon (or "stop codon") of a gene may have one of 15 three sequences, i.e., 5'-UAA, 5'-UAG and 5'-UGA corresponding DNA sequences are 5'-TAA, 5'-TAG and 5'-TGA, respectively). The terms "start codon region" "translation initiation codon region" refer to a portion of such an mRNA or gene that encompasses from about 25 to about 20 50 contiguous nucleotides in either direction (i.e., 5' or 3') from a translation initiation codon. Similarly, the terms "stop codon region" and "translation termination codon region" refer to a portion of such an mRNA or gene that encompasses from about 25 to about 50 contiguous nucleotides in either 25 direction (i.e., 5' or 3') from a translation termination codon.

The open reading frame (ORF) or "coding region," which is known in the art to refer to the region between the translation initiation codon and the translation termination codon, is also a region which may be targeted effectively. Other target regions include the 5' untranslated region (5'UTR), known in the art to refer to the portion of an mRNA in the 5' direction from the translation initiation codon, and thus including nucleotides between the 5' cap site and the translation initiation codon of an mRNA or corresponding

nucleotides on the gene, and the 3' untranslated region (3'UTR), known in the art to refer to the portion of an mRNA in the 3' direction from the translation termination codon, and thus including nucleotides between the translation termination codon and 3' end of an mRNA or corresponding nucleotides on the gene. The 5' cap of an mRNA comprises an N7-methylated guanosine residue joined to the 5'-most residue of the mRNA via a 5'-5' triphosphate linkage. The 5' cap region of an mRNA is considered to include the 5' cap structure itself as well as the first 50 nucleotides adjacent to the cap. The 5' cap region may also be a preferred target region.

Although some eukaryotic mRNA transcripts are directly translated, many contain one or more regions, known as 15 "introns," which are excised from a transcript before it is translated. The remaining (and therefore translated) regions are known as "exons" and are spliced together to form a continuous mRNA sequence. mRNA splice sites, i.e., intronexon junctions, may also be preferred target regions, and are 20 particularly useful in situations where aberrant splicing is implicated in disease, or where an overproduction of a particular mRNA splice product is implicated in disease. Aberrant fusion junctions due to rearrangements or deletions It has also been found that are also preferred targets. 25 introns can also be effective, and therefore preferred, target regions for antisense compounds targeted, for example, to DNA or pre-mRNA.

Once one or more target sites have been identified, oligonucleotides are chosen which are sufficiently complementary to the target, i.e., hybridize sufficiently well and with sufficient specificity, to give the desired effect.

In the context of this invention, "hybridization" means hydrogen bonding, which may be Watson-Crick, Hoogsteen or reversed Hoogsteen hydrogen bonding, between complementary nucleoside or nucleotide bases. For example, adenine and

8

thymine are complementary nucleobases which pair through the "Complementary," as used herein, formation of hydrogen bonds. refers to the capacity for precise pairing between two nucleotides. For example, if a nucleotide at a certain 5 position of an oligonucleotide is capable of hydrogen bonding with a nucleotide at the same position of a DNA or RNA molecule, then the oligonucleotide and the DNA or RNA are considered to be complementary to each other at that position. The oligonucleotide and the DNA or RNA are complementary to 10 each other when a sufficient number of corresponding positions in each molecule are occupied by nucleotides which can hydrogen bond with each other. Thus, "specifically hybridizable" and "complementary" are terms which are used to indicate a sufficient degree of complementarity or precise 15 pairing such that stable and specific binding occurs between the oligonucleotide and the DNA or RNA target. understood in the art that the sequence of an antisense compound need not be 100% complementary to that of its target nucleic acid to be specifically hybridizable. An antisense 20 compound is specifically hybridizable when binding of the compound to the target DNA or RNA molecule interferes with the normal function of the target DNA or RNA to cause a loss of utility, and there is a sufficient degree of complementarity to avoid non-specific binding of the antisense compound to 25 non-target sequences under conditions in which specific binding is desired, i.e., under physiological conditions in the case of in vivo assays or therapeutic treatment, or in the case of in vitro assays, under conditions in which the assays are performed.

Antisense compounds are commonly used as research reagents and diagnostics. For example, antisense oligonucleotides, which are able to inhibit gene expression with exquisite specificity, are often used by those of ordinary skill to elucidate the function of particular genes.

Antisense compounds are also used, for example, to distinguish

between functions of various members of a biological pathway. Antisense modulation has, therefore, been harnessed for research use.

The specificity and sensitivity of antisense is also barnessed by those of skill in the art for therapeutic uses. Antisense oligonucleotides have been employed as therapeutic moieties in the treatment of disease states in animals and man. Antisense oligonucleotides have been safely and effectively administered to humans and numerous clinical trials are presently underway. It is thus established that oligonucleotides can be useful therapeutic modalities that can be configured to be useful in treatment regimes for treatment of cells, tissues and animals, especially humans.

the context of this invention, the term In 15 "oligonucleotide" refers to an oligomer or polymer of ribonucleic acid (RNA) or deoxyribonucleic acid (DNA) or This term includes oligonucleotides mimetics thereof. composed of naturally-occurring nucleobases, sugars and covalent internucleoside (backbone) linkages as well as 20 oligonucleotides having non-naturally-occurring portions which modified or substituted function similarly. Such oligonucleotides are often preferred over native forms because for example, enhanced of desirable properties such as, cellular uptake, enhanced affinity for nucleic acid target and 25 increased stability in the presence of nucleases.

While antisense oligonucleotides are a preferred form of antisense compound, the present invention comprehends other oligomeric antisense compounds, including but not limited to oligonucleotide mimetics such as are described below. The antisense compounds in accordance with this invention preferably comprise from about 8 to about 30 nucleobases. Particularly preferred are antisense oligonucleotides comprising from about 8 to about 30 nucleobases (i.e. from about 8 to about 30 nucleobases (i.e. from about 8 to about 30 nucleobases (i.e. from about 8 to about 30 linked nucleosides). Preferred embodiments comprise at least an 8-nucleobase portion of a

10

sequence of an antisense compound which inhibits expression of Survivin. As is known in the art, a nucleoside is a basesugar combination. The base portion of the nucleoside is normally a heterocyclic base. The two most common classes of 5 such heterocyclic bases are the purines and the pyrimidines. Nucleotides are nucleosides that further include a phosphate group covalently linked to the sugar portion nucleoside. For those nucleosides that include pentofuranosyl sugar, the phosphate group can be linked to either the 2', 3' or 5' hydroxyl moiety of the sugar. forming oligonucleotides, the phosphate groups covalently link adjacent nucleosides to one another to form a linear polymeric compound. In turn the respective ends of this linear polymeric structure can be further joined to form a circular 15 structure, however, open linear structures are generally preferred. Within the oligonucleotide structure, phosphate groups are commonly referred to as forming the internucleoside backbone of the oligonucleotide. The normal linkage or backbone of RNA and DNA is a 3' 5′ to 20 phosphodiester linkage.

Specific examples of preferred antisense compounds useful in this invention include oligonucleotides containing modified backbones or non-natural internucleoside linkages. As defined in this specification, oligonucleotides having modified backbones include those that retain a phosphorus atom in the backbone and those that do not have a phosphorus atom in the backbone. For the purposes of this specification, and as sometimes referenced in the art, modified oligonucleotides that do not have a phosphorus atom in their internucleoside backbone can also be considered to be oligonucleosides.

Preferred modified oligonucleotide backbones include, for example, phosphorothioates, chiral phosphorothioates, phosphorodithioates, phosphorotriesters, aminoalkylphosphotriesters, methyl and other alkyl phosphonates including 3'- alkylene phosphonates and chiral phosphonates, phosphinates,

phosphoramidates including 3'-amino phosphoramidate and aminoalkylphosphoramidates, thionophosphoramidates, thiono-alkylphosphonates, thionoalkylphosphotriesters, and boranophosphates having normal 3'-5' linkages, 2'-5' linked analogs of these, and those having inverted polarity wherein the adjacent pairs of nucleoside units are linked 3'-5' to 5'-3' or 2'-5' to 5'-2'. Various salts, mixed salts and free acid forms are also included.

Representative United States patents that teach the 10 preparation of the above phosphorus-containing linkages include, but are not limited to, U.S. Patents 3,687,808; 4,469,863; 4,476,301; 5,023,243; 5,177,196; 5,188,897; 5,264,423; 5,276,019; 5,278,302; 5,286,717; 5,321,131; 5,455,233; 5,453,496; 5,466,677; 5,399,676; 5,405,939; 15 5,476,925; 5,519,126; 5,536,821; 5,541,306; 5,550,111; 5,563,253; 5,571,799; 5,587,361; and 5,625,050, each of which is herein incorporated by reference.

Preferred modified oligonucleotide backbones that do not include a phosphorus atom therein have backbones that are 20 formed by short chain alkyl or cycloalkyl internucleoside alkyl cycloalkyl heteroatom and orlinkages, mixed one or more short chain internucleoside linkages, or heteroatomic or heterocyclic internucleoside linkages. include those having morpholino linkages (formed in part from 25 the sugar portion of a nucleoside); siloxane backbones; sulfide, sulfoxide and sulfone backbones; formacetyl and backbones; methylene formacetyl and thioformacetyl alkene containing backbones; thioformacetyl backbones; sulfamate backbones; methyleneimino and methylenehydrazino 30 backbones; sulfonate and sulfonamide backbones; amide backbones; and others having mixed N, O, S and CH2 component parts.

Representative United States patents that teach the preparation of the above oligonucleosides include, but are not limited to, U.S. Patents 5,034,506; 5,166,315; 5,185,444;

12

5,214,134; 5,216,141; 5,235,033; 5,264,562; 5,264,564; 5,405,938; 5,434,257; 5,466,677; 5,470,967; 5,489,677; 5,541,307; 5,561,225; 5,596,086; 5,602,240; 5,610,289; 5;602,240; 5,608,046; 5,610,289; 5,618,704; 5,623,070; 5 5,663,312; 5,633,360; 5,677,437; and 5,677,439, each of which is herein incorporated by reference.

In other preferred oligonucleotide mimetics, both the sugar and the internucleoside linkage, i.e., the backbone, of the nucleotide units are replaced with novel groups. 10 units are maintained for hybridization with an appropriate nucleic acid target compound. One such oligomeric compound, an oligonucleotide mimetic that has been shown to have excellent hybridization properties, is referred to as a peptide nucleic acid (PNA). In PNA compounds, the sugar-15 backbone of an oligonucleotide is replaced with an amide containing backbone, in particular an aminoethylglycine backbone. The nucleobases are retained and are bound directly or indirectly to aza nitrogen atoms of the amide portion of the backbone. Representative United States patents that teach 20 the preparation of PNA compounds include, but are not limited to, U.S. Patents 5,539,082; 5,714,331; and 5,719,262, each of which is herein incorporated by reference. Further teaching of PNA compounds can be found in Nielsen et al., Science, **1991**, 254, 1497-1500.

25 Most preferred embodiments of the invention oligonucleotides with phosphorothioate backbones oligonucleosides with heteroatom backbones, and in particular $-CH_2-NH-O-CH_2-$, $-CH_2-N(CH_3)-O-CH_2-$ [known as a (methylimino) or MMI backbone], $-CH_2-O-N(CH_3)-CH_2-$, $-CH_2-N(CH_3)-CH_3-$ 30 N(CH₃)-CH₂and -O-N (CH₃) -CH₂-CH₂-[wherein the phosphodiester backbone is represented as -O-P-O-CH2-] of the above referenced U.S. Patent 5,489,677, and the amide backbones of the above referenced U.S. Patent 5,602,240. preferred are oligonucleotides having morpholino backbone 35 structures of the above-referenced U.S. Patent 5,034,506.

Modified oligonucleotides may also contain one or more Preferred oligonucleotides substituted sugar moieties. comprise one of the following at the 2' position: OH; F; O-, S-, or N-alkyl; O-, S-, or N-alkenyl; O-, S- or N-alkynyl; or 5 O-alkyl-O-alkyl, wherein the alkyl, alkenyl and alkynyl may be substituted or unsubstituted C_1 to C_{10} alkyl or C_2 to C_{10} preferred Particularly alkynyl. alkenyl and $O[(CH_2)_nO]_mCH_3$, $O(CH_2)_nOCH_3$, $O(CH_2)_nNH_2$, $O(CH_2)_nCH_3$, $O(CH_2)_nONH_2$, and $O(CH_2)_nON[(CH_2)_nCH_3)]_2$, where n and m are from 1 to about Other preferred oligonucleotides comprise one of the following at the 2' position: C_1 to C_{10} lower alkyl, substituted lower alkyl, alkaryl, aralkyl, O-alkaryl or Oaralkyl, SH, SCH3, OCN, Cl, Br, CN, CF3, OCF3, SOCH3, SO2CH3, $\mathrm{ONO_2}$, $\mathrm{NO_2}$, $\mathrm{N_3}$, $\mathrm{NH_2}$, heterocycloalkyl, heterocycloalkaryl, 15 aminoalkylamino, polyalkylamino, substituted silyl, an RNA cleaving group, a reporter group, an intercalator, a group for properties improving pharmacokinetic the oligonucleotide, or a group for improving the pharmacodynamic properties of an oligonucleotide, and other substituents 20 having similar properties. A preferred modification includes 2'-methoxyethoxy (2'-O-CH₂CH₂OCH₃, also known as 2'-O-(2methoxyethyl) or 2'-MOE) (Martin et al., Helv. Chim. Acta, 1995, 78, 486-504) i.e., an alkoxyalkoxy group. A further preferred modification includes 2'-dimethylaminooxyethoxy, 25 i.e., a $O(CH_2)$ $ON(CH_3)$ group, also known as 2'-DMAOE, as described in United States patent application Serial Number 09/016,520, filed on January 30, 1998, which is commonly owned with the instant application and the contents of which are herein incorporated by reference.

Other preferred modifications include 2'-methoxy (2'-0-30 CH_3), 2'-aminopropoxy (2'-OC $H_2CH_2CH_2NH_2$) and 2'-fluoro (2'-F). Similar modifications may also be made at other positions on the oligonucleotide, particularly the 3' position of the sugar linked in 2'-5' nucleotide orterminal the 5' position of 5' 35 oligonucleotides and the

WO 01/57059

14

nucleotide. Oligonucleotides may also have sugar mimetics such as cyclobutyl moieties in place of the pentofuranosyl Representative United States patents that teach the preparation of such modified sugar structures include, but are 5 not limited to, U.S. Patents 4,981,957; 5,118,800; 5,319,080; 5,359,044; 5,393,878; 5,446,137; 5,466,786; 5,519,134; 5,567,811; 5,576,427; 5,591,722; 5,597,909; 5,610,300; 5,627,0531 5,639,873; 5,646,265; 5,658,873; 5,670,633; and 5,700,920, each of which is herein incorporated 10 by reference in its entirety.

Oligonucleotides may also include nucleobase (often referred to in the art simply as "base") modifications or As used herein, "unmodified" or "natural" substitutions. nucleobases include the purine bases adenine (A) and guanine 15 (G), and the pyrimidine bases thymine (T), cytosine (C) and uracil (U). Modified nucleobases include other synthetic and natural nucleobases such as 5-methylcytosine (5-me-C), hydroxymethyl cytosine, xanthine, hypoxanthine, 2aminoadenine, 6-methyl and other alkyl derivatives of adenine 20 and guanine, 2-propyl and other alkyl derivatives of adenine and guanine, 2-thiouracil, 2-thiothymine and 2-thiocytosine, 5-halouracil and cytosine, 5-propynyl uracil and cytosine, 6azo uracil, cytosine and thymine, 5-uracil (pseudouracil), 4thiouracil, 8-halo, 8-amino, 8-thiol, 8-thioalkyl, 8-hydroxyl and other 8-substituted adenines and guanines, 5-halo particularly 5-bromo, 5-trifluoromethyl and other 5 substituted uracils and cytosines, 7-methylguanine and 7methyladenine, 8-azaguanine and 8-azaadenine, 7-deazaguanine and 7-deazaadenine and 3-deazaguanine and 3-deazaadenine. 30 Further nucleobases include those disclosed in U. S. Patent 3,687,808, those disclosed in The Concise Encyclopedia Of Polymer Science And Engineering, pages 858-859, Kroschwitz, J.I., ed. John Wiley & Sons, 1990, those disclosed by Englisch et al., Angewandte Chemie, International Edition, 1991, 30, 35 613, and those disclosed by Sanghvi, Y.S., Chapter 15,

Antisense Research and Applications, pages 289-302, Crooke, S.T. and Lebleu, B. , ed., CRC Press, 1993. Certain of these nucleobases are particularly useful for increasing the binding affinity of the oligomeric compounds of the invention. These 5 include 5-substituted pyrimidines, 6-azapyrimidines and N-2, N-6 and O-6 substituted purines, including 2-aminopropyl-5-propynylcytosine. adenine, 5-propynyluracil and methylcytosine substitutions have been shown to increase nucleic acid duplex stability by 0.6-1.2°C (Sanghvi, Y.S., 10 Crooke, S.T. and Lebleu, B., eds., Antisense Research and Applications, CRC Press, Boca Raton, 1993, pp. 276-278) and presently preferred base substitutions, even more particularly when combined with 2'-0-methoxyethyl sugar modifications.

Representative United States patents that teach the preparation of certain of the above noted modified nucleobases as well as other modified nucleobases include, but are not limited to, the above noted U.S. Patent 3,687,808, as well as U.S. Patents 4,845,205; 5,130,302; 5,134,066; 5,175,273; 5,367,066; 5,432,272; 5,457,187; 5,459,255; 5,484,908; 5,502,177; 5,525,711; 5,552,540; 5,587,469; 5,594,121, 5,596,091; 5,614,617; 5,681,941; and 5,750,692, each of which is herein incorporated by reference.

Another modification of the oligonucleotides of the 25 invention involves chemically linking to the oligonucleotide one or more moieties or conjugates which enhance the activity, cellular uptake distribution or cellular Such moieties include but are not limited oligonucleotide. to lipid moieties such as a cholesterol moiety (Letsinger et 30 al., Proc. Natl. Acad. Sci. USA, 1989, 86, 6553-6556), cholic acid (Manoharan et al., Bioorg. Med. Chem. Let., 1994, 4, 1053-1060), a thioether, e.g., hexyl-S-tritylthiol (Manoharan et al., Ann. N.Y. Acad. Sci., 1992, 660, 306-309; Manoharan et al., Bioorg. Med. Chem. Let., 1993, 3, 2765-2770), a

16

thiocholesterol (Oberhauser et al., Nucl. Acids Res., 1992, 20, 533-538), an aliphatic chain, e.g., dodecandiol or undecyl residues (Saison-Behmoaras et al., EMBO J., 1991, 10, 1111-1118; Kabanov et al., FEBS Lett., 1990, 259, 327-330; 5 Svinarchuk et al., Biochimie, 1993, 75, 49-54), phospholipid, e.g., di-hexadecyl-rac-glycerol or triethyl-1,2-di-O-hexadecyl-rac-glycero-3-H-phosphonate ammonium (Manoharan et al., Tetrahedron Lett., 1995, 36, 3651-3654; Shea et al., Nucl. Acids Res., 1990, 18, 3777-3783), a 10 polyamine or a polyethylene glycol chain (Manoharan et al., Nucleosides & Nucleotides, 1995, 14, 969-973), or adamantane acetic acid (Manoharan et al., Tetrahedron Lett., 1995, 36, 3651-3654), a palmityl moiety (Mishra et al., Biophys. Acta, 1995, 1264, 229-237), or an octadecylamine or 15 hexylamino-carbonyl-oxycholesterol moiety (Crooke et al., J. Pharmacol. Exp. Ther., 1996, 277, 923-937.

Representative United States patents that teach the preparation of such oligonucleotide conjugates include, but are not limited to, U.S. Patents 4,828,979; 4,948,882; 20 5,218,105; 5,525,465; 5,541,313; 5,545,730; 5,552,538; 5,578,717, 5,580,731; 5,580,731; 5,591,584; 5,109,124; 5,118,802; 5,138,045; 5,414,077; 5,486,603; 5,512,439; 5,578,718; 5,608,046; 4,587,044; 4,605,735; 4,667,025; 4,762,779; 4,789,737; 4,824,941; 4,835,263; 4,876,335; 25 4,904,582; 4,958,013; 5,082,830; 5,112,963; 5,214,136; 5,082,830; 5,112,963; 5,214,136; 5,245,022; 5,254,469; 5,258,506; 5,262,536; 5,272,250; 5,292,873; 5,317,098; 5,371,241, 5,391,723; 5,416,203, 5,451,463; 5,510,475; 5,512,667; 5,514,785; 5,565,552; 5,567,810; 5,574,142; 30 5,585,481; 5,587,371; 5,595,726; 5,597,696; 5,599,923; 5,599,928 and 5,688,941, each of which is herein incorporated by reference.

It is not necessary for all positions in a given compound to be uniformly modified, and in fact more than one

17

of the aforementioned modifications may be incorporated in a single compound or even at a single nucleoside within an The present invention also includes oligonucleotide. antisense compounds which are chimeric compounds. "Chimeric" 5 antisense compounds or "chimeras," in the context of this particularly compounds, invention, are antisense which contain two or more chemically oligonucleotides, distinct regions, each made up of at least one monomer unit, i.e., a nucleotide in the case of an oligonucleotide compound. 10 These oligonucleotides typically contain at least one region wherein the oligonucleotide is modified so as to confer upon to nuclease increased resistance oligonucleotide the degradation, increased cellular uptake, and/or increased binding affinity for the target nucleic acid. An additional 15 region of the oligonucleotide may serve as a substrate for enzymes capable of cleaving RNA:DNA or RNA:RNA hybrids. way of example, RNase H is a cellular endonuclease which cleaves the RNA strand of an RNA:DNA duplex. Activation of RNase H, therefore, results in cleavage of the RNA target, 20 thereby greatly enhancing the efficiency of oligonucleotide inhibition of gene expression. Consequently, comparable results can often be obtained with shorter oligonucleotides oligonucleotides are used, compared chimeric phosphorothicate deoxyoligonucleotides hybridizing to the same Cleavage of the RNA target can be routinely 25 target region. detected by gel electrophoresis and, if necessary, associated nucleic acid hybridization techniques known in the art.

Chimeric antisense compounds of the invention may be formed as composite structures of two or more oligonucleotides, modified oligonucleotides, oligonucleosides and/or oligonucleotide mimetics as described above. Such compounds have also been referred to in the art as hybrids or gapmers. Representative United States patents that teach the preparation of such hybrid structures include, but are not limited to, U.S. Patents 5,013,830; 5,149,797; 5,220,007;

5,256,775; 5,366,878; 5,403,711; 5,491,133; 5,565,350; 5,623,065; 5,652,355; 5,652,356; and 5,700,922, each of which is herein incorporated by reference in its entirety.

18

The antisense compounds used in accordance with this invention may be conveniently and routinely made through the well-known technique of solid phase synthesis. Equipment for such synthesis is sold by several vendors including, for example, Applied Biosystems (Foster City, CA). Any other means for such synthesis known in the art may additionally or alternatively be employed. It is well known to use similar techniques to prepare oligonucleotides such as the phosphorothioates and alkylated derivatives.

The antisense compounds of the invention are synthesized in vitro and do not include antisense compositions of biological origin, or genetic vector constructs designed to direct the *in vivo* synthesis of antisense molecules.

The compounds of the invention may also be admixed, encapsulated, conjugated or otherwise associated with other molecules, molecule structures or mixtures of compounds, as

- for example, liposomes, receptor targeted molecules, oral, rectal, topical or other formulations, for assisting in uptake, distribution and/or absorption. Representative United States patents that teach the preparation of such uptake, distribution and/or absorption assisting formulations include,
- 25 but are not limited to, U.S. Patents 5,108,921; 5,354,844; ~5,416,016; 5,459,127; 5,521,291; 5,543,158; 5,547,932; 5,583,020; 5,591,721; 4,426,330; 4,534,899; 5,013,556; 5,108,921; 5,213,804; 5,227,170; 5,264,221; 5,356,633; 5,395,619; 5,416,016; 5,417,978; 5,462,854; 5,469,854;
- 30 5,512,295; 5,527,528; 5,534,259; 5,543,152; 5,556,948; 5,580,575; and 5,595,756, each of which is herein incorporated by reference.

The antisense compounds of the invention encompass any pharmaceutically acceptable salts, esters, or salts of such 35 esters, or any other compound which, upon administration to

PCT/US01/02939

an animal including a human, is capable of providing (directly or indirectly) the biologically active metabolite or residue thereof. Accordingly, for example, the disclosure is also drawn to prodrugs and pharmaceutically acceptable salts of the compounds of the invention, pharmaceutically acceptable salts of such prodrugs, and other bioequivalents.

The term "prodrug" indicates a therapeutic agent that is prepared in an inactive form that is converted to an active form (i.e., drug) within the body or cells thereof by the action of endogenous enzymes or other chemicals and/or conditions. In particular, prodrug versions of the oligonucleotides of the invention are prepared as SATE [(S-acetyl-2-thioethyl) phosphate] derivatives according to the methods disclosed in WO 93/24510 to Gosselin et al., published December 9, 1993 or in WO 94/26764 to Imbach et al.

The term "pharmaceutically acceptable salts" refers to physiologically and pharmaceutically acceptable salts of the compounds of the invention: i.e., salts that retain the desired biological activity of the parent compound and do not impart undesired toxicological effects thereto.

Pharmaceutically acceptable base addition salts are formed with metals or amines, such as alkali and alkaline Examples of metals used as earth metals or organic amines. cations are sodium, potassium, magnesium, calcium, and the suitable amines are 25 like. Examples οf chloroprocaine, N, N'-dibenzylethylenediamine, dicyclohexylamine, ethylenediamine, diethanolamine, N-methylglucamine, and procaine (see, for example, Berge et al., "Pharmaceutical Salts," J. of Pharma Sci., 1977, 66, 1-The base addition salts of said acidic compounds are prepared by contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner. The free acid form may be regenerated by contacting the salt form with an acid and isolating the 35 free acid in the conventional manner. The free acid forms

20

differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acid for purposes of the present invention. As used herein, 5 a "pharmaceutical addition salt" includes a pharmaceutically acceptable salt of an acid form of one of the components of the compositions of the invention. These include organic or inorganic acid salts of the amines. Preferred acid salts are the hydrochlorides, acetates, salicylates, nitrates and ·10 phosphates. Other suitable pharmaceutically acceptable salts are well known to those skilled in the art and include basic salts of a variety of inorganic and organic acids, such as, for example, with inorganic acids, such as for example hydrochloric acid, hydrobromic acid, sulfuric 15 phosphoric acid; with organic carboxylic, sulfonic, sulfo or phospho acids or N-substituted sulfamic acids, for example acetic acid, propionic acid, glycolic acid, succinic acid, maleic acid, hydroxymaleic acid, methylmaleic acid, fumaric acid, malic acid, tartaric acid, lactic acid, oxalic acid, 20 gluconic acid, glucaric acid, glucuronic acid, citric acid, benzoic acid, cinnamic acid, mandelic acid, salicylic acid, 4-aminosalicylic acid, 2-phenoxybenzoic acid, 2-acetoxybenzoic acid, embonic acid, nicotinic acid or isonicotinic acid; and with amino acids, such as the 20 alpha-amino acids involved 25 in the synthesis of proteins in nature, for example glutamic acid or aspartic acid, and also with phenylacetic acid, methanesulfonic acid, ethanesulfonic 2-hydroxyethanesulfonic acid, ethane-1,2-disulfonic benzenesulfonic acid, 4-methylbenzenesulfoic 30 naphthalene-2-sulfonic acid, naphthalene-1,5-disulfonic acid, 3-phosphoglycerate, glucose-6-phosphate, N-cyclohexylsulfamic acid (with the formation of cyclamates), or with other acid organic compounds, such as ascorbic acid. Pharmaceutically acceptable salts of compounds may also be 35 prepared with a pharmaceutically acceptable cation. Suitable

pharmaceutically acceptable cations are well known to those skilled in the art and include alkaline, alkaline earth, ammonium and quaternary ammonium cations. Carbonates or hydrogen carbonates are also possible.

oligonucleotides,

5

For

preferred

examples

of

pharmaceutically acceptable salts include but are not limited to (a) salts formed with cations such as sodium, potassium, ammonium, magnesium, calcium, polyamines such as spermine and (b) acid addition salts formed with etc.; spermidine, 10 inorganic acids, for example hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, nitric acid and the with organic acids such as, for formed like; (c) salts example, acetic acid, oxalic acid, tartaric acid, succinic acid, maleic acid, fumaric acid, gluconic acid, citric acid, ascorbic acid, benzoic acid, tannic acid, 15 malic acid, polyglutamic acid, acid, palmitic acid, alginic methanesulfonic naphthalenesulfonic acid, naphthalenedisulfonic acid, p-toluenesulfonic polygalacturonic acid, and the like; and (d) salts formed from 20 elemental anions such as chlorine, bromine, and iodine. The antisense compounds of the present invention can be utilized for diagnostics, therapeutics, prophylaxis and as For therapeutics, an animal, research reagents and kits. preferably a human, suspected of having a disease or disorder 25 which can be treated by modulating the expression of Survivin is treated by administering antisense compounds in accordance The compounds of the invention can be with this invention. utilized in pharmaceutical compositions by adding an effective amount of an antisense compound to a suitable pharmaceutically 30 acceptable diluent or carrier. Use of the antisense compounds also be useful invention may methods of the e.g., to prevent or delay infection, prophylactically, inflammation or tumor formation, for example.

The antisense compounds of the invention are useful for research and diagnostics, because these compounds hybridize

.

WO 01/57059

to nucleic acids encoding Survivin, enabling sandwich and other assays to easily be constructed to exploit this fact. Hybridization of the antisense oligonucleotides of invention with a nucleic acid encoding Survivin can be 5 detected by means known in the art. Such means may include conjugation of an enzyme to the oligonucleotide, radiolabelling of the oligonucleotide or any other suitable detection means. Kits using such detection means for detecting the level of Survivin in a sample may also be 10 prepared.

22

PCT/US01/02939

The present invention also includes pharmaceutical compositions and formulations which include the antisense compounds of the invention. The pharmaceutical compositions of the present invention may be administered in a number of 15 ways depending upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including ophthalmic and to mucous membranes including vaginal and rectal delivery), pulmonary, e.g., by inhalation or insufflation of powders or aerosols, including intranasal, nebulizer; intratracheal, epidermal, intradermal and transdermal, oral or parenteral. Parenteral administration includes intravenous, intraarterial. subcutaneous, intraperitoneal or intramuscular injection, drip infusion; intracranial, intrathecal or e.g., 25 intraventricular, administration. Oligonucleotides with at least one 2'-O-methoxyethyl modification are believed to be particularly useful for oral administration.

Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable. Coated condoms, gloves and the like may also be useful.

Compositions and formulations for oral administration include powders or granules, suspensions or solutions in water or non-aqueous media, capsules, sachets or tablets. Thickeners, flavoring agents, diluents, emulsifiers, dispersing aids or binders may be desirable.

Compositions and formulations for parenteral, intrathecal or intraventricular administration may include sterile aqueous solutions which may also contain buffers, diluents and other suitable additives such as, but not limited to, penetration enhancers, carrier compounds and other pharmaceutically acceptable carriers or excipients.

compositions and/or formulations Pharmaceutical comprising the oligonucleotides of the present invention may also include penetration enhancers in order to enhance the 15 alimentary delivery of the oligonucleotides. Penetration enhancers may be classified as belonging to one of five broad categories, i.e., fatty acids, bile salts, chelating agents, surfactants and non-surfactants (Lee et al., Critical Reviews in Therapeutic Drug Carrier Systems, 1991, 8, 20 Muranishi, Critical Reviews in Therapeutic Drug Carrier Systems, 1990, 7:1, 1-33). One or more penetration enhancers from one or more of these broad categories may be included.

Various fatty acids and their derivatives which act as penetration enhancers include, for example, oleic acid, lauric 25 acid, capric acid, myristic acid, palmitic acid, stearic acid, dicaprate, tricaprate, acid, linoleic acid, linolenic 1-monooleoyl-rac-glycerol), recinleate, monoolein (a.k.a. arichidonic acid, qlyceryl acid, caprylic dilaurin, 1-monocaprate, 1-dodecylazacycloheptan-2-one, acylcarnitines, 30 acylcholines, mono- and di-glycerides and physiologically acceptable salts thereof (i.e., oleate, laurate, caprate, myristate, palmitate, stearate, linoleate, etc.) (Lee et al., Critical Reviews in Therapeutic Drug Carrier Systems, 1991, 8:2, 91-192; Muranishi, Critical Reviews in Therapeutic Drug

24

Carrier Systems, 1990, 7:1, 1-33; El-Hariri et al., J. Pharm. Pharmacol., 1992, 44, 651-654). Examples of some presently preferred fatty acids are sodium caprate and sodium laurate, used singly or in combination at concentrations of 0.5 to 5%.

The physiological roles of bile include the facilitation of dispersion and absorption of lipids and fat-soluble vitamins (Brunton, Chapter 38 In: Goodman & Gilman's The Pharmacological Basis of Therapeutics, 9th Ed., Hardman et al., eds., McGraw-Hill, New York, NY, 1996, pages 934-935).

10 Various natural bile salts, and their synthetic derivatives, act as penetration enhancers. Thus, the term "bile salt" includes any of the naturally occurring components of bile as

presently preferred bile salts are chenodeoxycholic acid (CDCA) and/or ursodeoxycholic acid (UDCA), generally used at concentrations of 0.5 to 2%.

Examples of

well as any of their synthetic derivatives.

Complex formulations comprising one or more penetration enhancers may be used. For example, bile salts may be used in combination with fatty acids to make complex formulations.

20 Preferred combinations include CDCA combined with sodium caprate or sodium laurate (generally 0.5 to 5%).

Chelating agents include, but are not limited to, disodium ethylenediaminetetraacetate (EDTA), citric acid, salicylates (e.g., sodium salicylate, 5-methoxysalicylate and homovanilate), N-acyl derivatives of collagen, laureth-9 and N-amino acyl derivatives of beta-diketones (enamines) (Lee et al., Critical Reviews in Therapeutic Drug Carrier Systems, 1991, 8:2, 92-192; Muranishi, Critical Reviews in Therapeutic Drug Carrier Systems, 1990, 7:1, 1-33; Buur et al., J. Control Rel., 1990, 14, 43-51). Chelating agents have the added advantage of also serving as DNase inhibitors.

Surfactants include, for example, sodium lauryl sulfate, polyoxyethylene-9-lauryl ether and polyoxyethylene-20-cetyl ether (Lee et al., Critical Reviews in Therapeutic Drug

Carrier Systems, 1991, 8:2, 92-191); and perfluorochemical emulsions, such as FC-43 (Takahashi et al., J. Pharm. Pharmacol., 1988, 40, 252-257).

Non-surfactants include, for example, unsaturated cyclic ureas, 1-alkyl- and 1-alkenylazacyclo-alkanone derivatives (Lee et al., Critical Reviews in Therapeutic Drug Carrier Systems, 1991, 8:2, 92-191); and non-steroidal anti-inflammatory agents such as diclofenac sodium, indomethacin and phenylbutazone (Yamashita et al., J. Pharm. Pharmacol., 10 1987, 39, 621-626).

As used herein, "carrier compound" refers to a nucleic acid, or analog thereof, which is inert (i.e., does not possess biological activity per se) but is recognized as a acid by in vivo processes that reduce the nucleic 15 bioavailability of a nucleic acid having biological activity by, for example, degrading the biologically active nucleic acid or promoting its removal from circulation. coadministration of a nucleic acid and a carrier compound, typically with an excess of the latter substance, can result 20 in a substantial reduction of the amount of nucleic acid recovered in the liver, kidney or other extracirculatory reservoirs, presumably due to competition between the carrier compound and the nucleic acid for a common receptor. example, the recovery of a partially phosphorothicated 25 oligonucleotide in hepatic tissue is reduced when it is coadministered with polyinosinic acid, dextran sulfate, polycytidic acid or 4-acetamido-4'-isothiocyano-stilbene-2,2'-disulfonic acid (Miyao et al., Antisense Res. Dev., 1995, 5, 115-121; Takakura et al., Antisense & Nucl. Acid Drug Dev., 30 1996, 6, 177-183).

In contrast to a carrier compound, a "pharmaceutically acceptable carrier" (excipient) is a pharmaceutically acceptable solvent, suspending agent or any other pharmacologically inert vehicle for delivering one or more

nucleic acids to an animal. The pharmaceutically acceptable carrier may be liquid or solid and is selected with the planned manner of administration in mind so as to provide for the desired bulk, consistency, etc., when combined with a 5 nucleic acid and the other components of pharmaceutical composition. Typical pharmaceutically acceptable carriers include, but are not limited to, binding pregelatinized maize starch, (e.g., polyvinylpyrrolidone or hydroxypropyl methylcellulose, etc.); fillers 10 (e.g., lactose and other sugars, microcrystalline cellulose, gelatin, calcium sulfate, ethyl polyacrylates or calcium hydrogen phosphate, etc.); lubricants (e.g., magnesium stearate, talc, silica, colloidal silicon stearic acid, metallic stearates, hydrogenated dioxide, 15 vegetable oils, corn starch, polyethylene glycols, sodium benzoate, sodium acetate, etc.); disintegrates (e.g., starch, sodium starch glycolate, etc.); or wetting agents (e.g., Sustained release oral sodium lauryl sulphate, etc.). and/or enteric coatings for delivery systems 20 administered dosage forms are described in U.S. 4,704,295; 4,556,552; 4,309,406; and 4,309,404.

compositions of the present invention The additionally contain other adjunct components conventionally found in pharmaceutical compositions, at their art-established 25 usage levels. Thus, for example, the compositions may contain additional compatible pharmaceutically-active materials such as, e.g., antipruritics, astringents, local anesthetics or anti-inflammatory agents, or may contain additional materials useful in physically formulating various dosage forms of the 30 composition of present invention, such as dyes, flavoring agents, preservatives, antioxidants, opacifiers, thickening agents and stabilizers. However, such materials, when added, should not unduly interfere with the biological activities of the components of the compositions of the invention.

Regardless of the method by which the antisense compounds of the invention are introduced into a patient, colloidal dispersion systems may be used as delivery vehicles to enhance the in vivo stability of the compounds and/or to 5 target the compounds to a particular organ, tissue or cell Colloidal dispersion systems include, but are not type. nanocapsules, complexes, limited to, macromolecule microspheres, beads and lipid-based systems including oil-inwater emulsions, micelles, mixed micelles, liposomes and 10 lipid:oligonucleotide complexes of uncharacterized structure. A preferred colloidal dispersion system is a plurality of Liposomes are microscopic spheres having an liposomes. aqueous core surrounded by one or more outer layer(s) made up of lipids arranged in a bilayer configuration (see, generally, 15 Chonn et al., Current Op. Biotech., 1995, 6, 698-708).

Certain embodiments of the invention provide for liposomes and other compositions containing (a) one or more antisense compounds and (b) one or more other chemotherapeutic agents which function by a non-antisense mechanism. Examples 20 of such chemotherapeutic agents include but are not limited dactinomycin, doxorubicin, daunomycin, daunorubicin, epirubicin, idarubicin, esorubicin, bleomycin, mafosfamide, ifosfamide, cytosine arabinoside, bis-chloroethylnitrosurea, busulfan, mitomycin C, actinomycin D, mithramycin, prednisone, 25 hydroxyprogesterone, testosterone, tamoxifen, dacarbazine, hexamethylmelamine, pentamethylmelamine, procarbazine, amsacrine, chlorambucil, mitoxantrone, methylcyclohexylnitrosurea, nitrogen mustards, melphalan, cyclophosphamide, 6-mercaptopurine, 6-thioguanine, cytarabine, deoxycoformycin, 30 5-azacytidine, hydroxyurea, hydroxyperoxycyclophosphoramide, 5-fluorouracil (5-FU), fluorodeoxyuridine (5-FUdR), methotrexate (MTX), colchicine, vinblastine, etoposide (VP-16), taxol, vincristine, trimetrexate, irinotecan, topotecan, gemcitabine, teniposide, 35 cisplatin and diethylstilbestrol (DES). See, generally, The •

28

PCT/US01/02939

Merck Manual of Diagnosis and Therapy, 15th Ed. 1987, pp. 1206-1228, Berkow et al., eds., Rahway, N.J. When used with the compounds of the invention, such chemotherapeutic agents may be used individually (e.g., 5-FU and oligonucleotide), sequentially (e.g., 5-FU and oligonucleotide for a period of time followed by MTX and oligonucleotide), or in combination with one or more other such chemotherapeutic agents (e.g., 5-FU, MTX and oligonucleotide, or 5-FU, radiotherapy and oligonucleotide).

10 Anti-inflammatory drugs, including but not limited to nonsteroidal anti-inflammatory drugs and corticosteroids, and antiviral drugs, including but not limited to ribivirin, vidarabine, acyclovir and ganciclovir, may also be combined in compositions of the invention. See, generally, The Merck 15 Manual of Diagnosis and Therapy, 15th Ed., Berkow et al., eds., 1987, Rahway, N.J., pages 2499-2506 and 46-49, respectively). Other non-antisense chemotherapeutic agents are also within the scope of this invention. Two or more combined compounds may be used together or sequentially.

20 In another related embodiment, compositions of the invention may contain one or more antisense compounds, particularly oligonucleotides, targeted to a first nucleic acid and one or more additional antisense compounds targeted to a second nucleic acid target. Examples of antisense .25 oligonucleotides include, but are not limited to, directed to the following targets as disclosed in the indicated U.S. Patents, or pending U.S. applications, which are commonly owned with the instant application and are hereby incorporated by reference, or the indicated published PCT 30 applications: raf (WO 96/39415, WO 95/32987 and U.S. Patents 5,563,255 and 5,656,612), the pl20 nucleolar antigen (WO 93/17125 and U.S. Patent 5,656,743), protein kinase C (WO 95/02069, WO 95/03833 and WO 93/19203), multidrug resistanceassociated protein (WO 95/10938 and U.S. Patent 5,510,239),

29

subunits of transcription factor AP-1 (pending application U.S. Serial No. 08/837,201, filed April 14, 1997), Jun kinases (pending application U.S. Serial No. 08/910,629, filed August 13, 1997), MDR-1 (multidrug resistance glycoprotein; pending application U.S. Serial No. 08/731,199, filed September 30, 1997), HIV (U.S. Patents 5,166,195 and 5,591,600), herpesvirus (U.S. Patents 5,248,670 and 5,514,577), cytomegalovirus (U.S. Patents 5,442,049 and 5,591,720), papillomavirus (U.S. Patent 5,457,189), intercellular adhesion molecule-1 (ICAM-1) (U.S. Patent 5,514,788), 5-lipoxygenase (U.S. Patent 5,530,114) and influenza virus (U.S. Patent 5,580,767). Two or more combined compounds may be used together or sequentially.

The formulation of therapeutic compositions and their subsequent administration is believed to be within the skill 15 of those in the art. Dosing is dependent on severity and responsiveness of the disease state to be treated, with the course of treatment lasting from several days to several months, or until a cure is effected or a diminution of the disease state is achieved. Optimal dosing schedules can be 20 calculated from measurements of drug accumulation in the body Persons of ordinary skill can easily of the patient. determine optimum dosages, dosing methodologies and repetition Optimum dosages may vary depending on the relative potency of individual oligonucleotides, and can generally be 25 estimated based on EC_{so}s found to be effective in in vitro and in vivo animal models. In general, dosage is from 0.01 μg to 100 g per kg of body weight, and may be given once or more daily, weekly, monthly or yearly, or even once every 2 to 20 Persons of ordinary skill in the art can easily years. 30 estimate repetition rates for dosing based on measured residence times and concentrations of the drug in bodily fluids or tissues. Following successful treatment, it may be desirable to have the patient undergo maintenance therapy to prevent the recurrence of the disease state, wherein the 35 oligonucleotide is administered in maintenance doses, ranging from 0.01 μg to 100 g per kg of body weight, once or more daily, to once every 20 years.

While the present invention has been described with specificity in accordance with certain of its preferred embodiments, the following examples serve only to illustrate the invention and are not intended to limit the same.

EXAMPLES

Example 1

Nucleoside phosphoramidites for oligonucleotide synthesis 10 deoxy and 2'-alkoxy amidites

2'-Deoxy and 2'-methoxy beta-cyanoethyldiisopropyl phosphoramidites were purchased from commercial sources (e.g. Chemgenes, Needham MA or Glen Research, Inc. Sterling VA). Other 2'-O-alkoxy substituted nucleoside amidites are prepared as described in U.S. Patent 5,506,351, herein incorporated by reference. For oligonucleotides synthesized using 2'-alkoxy amidites, the standard cycle for unmodified oligonucleotides was utilized, except the wait step after pulse delivery of tetrazole and base was increased to 360 seconds.

Oligonucleotides containing 5-methyl-2'-deoxycytidine (5-Me-C) nucleotides were synthesized according to published methods [Sanghvi, et. al., *Nucleic Acids Research*, 1993, 21, 3197-3203] using commercially available phosphoramidites (Glen Research, Sterling VA or ChemGenes, Needham MA).

25 2'-Fluoro amidites

2'-Fluorodeoxyadenosine amidites

2'-fluoro oligonucleotides were synthesized as described previously [Kawasaki, et. al., J. Med. Chem., 1993, 36, 831-841] and U. S. Patent 5,670,633, herein incorporated by reference. Briefly, the protected nucleoside N6-benzoyl-2'-deoxy-2'-fluoroadenosine was synthesized utilizing

commercially available 9-beta-D-arabinofuranosyladenine as starting material and by modifying literature procedures whereby the 2'-alpha-fluoro atom is introduced by a S_N2-displacement of a 2'-beta-trityl group. Thus N6-benzoyl-9-beta-D-arabinofuranosyladenine was selectively protected in moderate yield as the 3',5'-ditetrahydropyranyl (THP) intermediate. Deprotection of the THP and N6-benzoyl groups was accomplished using standard methodologies and standard methods were used to obtain the 5'-dimethoxytrityl-(DMT) and 5'-DMT-3'-phosphoramidite intermediates.

2'-Fluorodeoxyguanosine

2'-deoxy-2'-fluoroguanosine of synthesis The accomplished using tetraisopropyldisiloxanyl (TPDS) protected 9-beta-D-arabinofuranosylguanine as starting material, and diisobutyrylintermediate 15 conversion the arabinofuranosylguanosine. Deprotection of the TPDS group was followed by protection of the hydroxyl group with THP to give protected arabinofuranosylguanine. di-THP diisobutyryl Selective O-deacylation and triflation was followed by product with fluoride, of crude 20 treatment the deprotection of the THP groups. Standard methodologies were used to obtain the 5'-DMT- and 5'-DMT-3'-phosphoramidites.

2'-Fluorouridine

Synthesis of 2'-deoxy-2'-fluorouridine was accomplished 25 by the modification of a literature procedure in which 2,2'-anhydro-1-beta-D-arabinofuranosyluracil was treated with 70% hydrogen fluoride-pyridine. Standard procedures were used to obtain the 5'-DMT and 5'-DMT-3'phosphoramidites.

2'-Fluorodeoxycytidine

2'-deoxy-2'-fluorocytidine was synthesized via amination of 2'-deoxy-2'-fluorouridine, followed by selective protection to give N4-benzoyl-2'-deoxy-2'-fluorocytidine. Standard

procedures were used to obtain the 5'-DMT and 5'-DMT-3'phosphoramidites.

2'-0-(2-Methoxyethyl) modified amidites

2'-O-Methoxyethyl-substituted nucleoside amidites are 5 prepared as follows, or alternatively, as per the methods of Martin, P., Helvetica Chimica Acta, 1995, 78, 486-504.

2,2'-Anhydro[1-(beta-D-arabinofuranosyl)-5-methyluridine]

5-Methyluridine (ribosylthymine, commercially available 10 through Yamasa, Choshi, Japan) (72.0 g, 0.279 M), diphenylcarbonate (90.0 g, 0.420 M) and sodium bicarbonate (2.0 g, 0.024 M) were added to DMF (300 mL). The mixture was heated to reflux, with stirring, allowing the evolved carbon dioxide 15 gas to be released in a controlled manner. After 1 hour, the slightly darkened solution was concentrated under reduced pressure. The resulting syrup was poured into diethylether (2.5 L), with stirring. The product formed a gum. was decanted and the residue was dissolved in a minimum amount 20 of methanol (ca. 400 mL). The solution was poured into fresh ether (2.5 L) to yield a stiff qum. The ether was decanted and the gum was dried in a vacuum oven (60°C at 1 mm Hg for 24 h) to give a solid that was crushed to a light tan powder (57 g, 85% crude yield). The NMR spectrum was consistent with the 725 structure, contaminated with phenol as its sodium salt (ca. The material was used as is for further reactions (or it can be purified further by column chromatography using a gradient of methanol in ethyl acetate (10-25%) to give a white solid, mp 222-4°C).

2'-O-Methoxyethyl-5-methyluridine

30

2,2'-Anhydro-5-methyluridine (195 g, 0.81 M), tris(2-methoxyethyl)borate (231 g, 0.98 M) and 2-methoxyethanol (1.2

L) were added to a 2 L stainless steel pressure vessel and placed in a pre-heated oil bath at 160°C. After heating for 48 hours at 155-160°C, the vessel was opened and the solution evaporated to dryness and triturated with MeOH (200 mL). The residue was suspended in hot acetone (1 L). The insoluble salts were filtered, washed with acetone (150 mL) and the filtrate evaporated. The residue (280 g) was dissolved in CH₃CN (600 mL) and evaporated. A silica gel column (3 kg) was packed in CH₂Cl₂/Acetone/MeOH (20:5:3) containing 0.5% Et₃NH.

The residue was dissolved in CH₂Cl₂ (250 mL) and adsorbed onto silica (150 g) prior to loading onto the column. The product was eluted with the packing solvent to give 160 g (63%) of product. Additional material was obtained by reworking impure fractions.

2'-0-Methoxyethyl-5'-0-dimethoxytrityl-5-methyluridine

2'-O-Methoxyethyl-5-methyluridine (160 g, 0.506 M) was co-evaporated with pyridine (250 mL) and the dried residue A first aliquot of dissolved in pyridine (1.3 L). dimethoxytrityl chloride (94.3 g, 0.278 M) was added and the 20 mixture stirred at room temperature for one hour. A second aliquot of dimethoxytrityl chloride (94.3 g, 0.278 M) was added and the reaction stirred for an additional one hour. Methanol (170 mL) was then added to stop the reaction. showed the presence of approximately 70% product. The solvent 25 was evaporated and triturated with CH_3CN (200 mL). residue was dissolved in CHCl₃ (1.5 L) and extracted with 2x500~mL of saturated NaHCO3 and 2x500~mL of saturated NaCl. The organic phase was dried over Na₂SO₄, filtered and evaporated. 275 g of residue was obtained. The residue was 30 purified on a 3.5 kg silica gel column, packed and eluted with EtOAc/Hexane/Acetone (5:5:1) containing 0.5% Et₃NH. fractions were evaporated to give 164 g of Approximately 20 g additional was obtained from the impure fractions to give a total yield of 183 g (57%).

3'-0-Acetyl-2'-0-methoxyethyl-5'-0-dimethoxytrityl-5-methyluridine

2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine (106 g, 0.167 M), DMF/pyridine (750 mL of a 3:1 mixture 5 prepared from 562 mL of DMF and 188 mL of pyridine) and acetic anhydride (24.38 mL, 0.258 M) were combined and stirred at room temperature for 24 hours. The reaction was monitored by tlc by first quenching the tlc sample with the addition of MeOH. Upon completion of the reaction, as judged by tlc, MeOH 10 (50 mL) was added and the mixture evaporated at 35°C. residue was dissolved in CHCl3 (800 mL) and extracted with 2x200 mL of saturated sodium bicarbonate and 2x200 mL of saturated NaCl. The water layers were back extracted with 200 mL of CHCl3. The combined organics were dried with sodium 15 sulfate and evaporated to give 122 g of residue (approx. 90% product). The residue was purified on a 3.5 kg silica gel column and eluted using EtOAc/Hexane(4:1). Pure product fractions were evaporated to yield 96 g (84%). An additional 1.5 g was recovered from later fractions.

3'-O-Acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5methyl-4-triazoleuridine

A first solution was prepared by dissolving 3'-O-acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyluridine (96 g, 0.144 M) in CH₃CN (700 mL) and set aside. Triethylamine (189 mL, 1.44 M) was added to a solution of triazole (90 g, 1.3 M) in CH₃CN (1 L), cooled to -5°C and stirred for 0.5 hours using an overhead stirrer. POCl₃ was added dropwise, over a 30 minute period, to the stirred solution maintained at 0-10°C, and the resulting mixture stirred for an additional 2 hours.

30 The first solution was added dropwise, over a 45 minute period, to the latter solution. The resulting reaction mixture was stored overnight in a cold room. Salts were

35

filtered from the reaction mixture and the solution was evaporated. The residue was dissolved in EtOAc (1 L) and the insoluble solids were removed by filtration. The filtrate was washed with 1x300 mL of NaHCO₃ and 2x300 mL of saturated NaCl, dried over sodium sulfate and evaporated. The residue was triturated with EtOAc to give the title compound.

2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine

A solution of 3'-O-acetyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methyl-4-triazoleuridine (103 g, 0.141 M) in dioxane (500 mL) and NH₄OH (30 mL) was stirred at room temperature for 2 hours. The dioxane solution was evaporated and the residue azeotroped with MeOH (2x200 mL). The residue was dissolved in MeOH (300 mL) and transferred to a 2 liter stainless steel pressure vessel. MeOH (400 mL) saturated with NH₃ gas was added and the vessel heated to 100°C for 2 hours (tlc showed complete conversion). The vessel contents were evaporated to dryness and the residue was dissolved in EtOAc (500 mL) and washed once with saturated NaCl (200 mL). The organics were dried over sodium sulfate and the solvent was evaporated to give 85 g (95%) of the title compound.

N4-Benzoyl-2'-0-methoxyethyl-5'-0-dimethoxytrityl-5-methylcytidine

2'-O-Methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine (85 g, 0.134 M) was dissolved in DMF (800 mL) and benzoic anhydride (37.2 g, 0.165 M) was added with stirring. After stirring for 3 hours, tlc showed the reaction to be approximately 95% complete. The solvent was evaporated and the residue azeotroped with MeOH (200 mL). The residue was dissolved in CHCl, (700 mL) and extracted with saturated NaHCO, (2x300 mL) and saturated NaCl (2x300 mL), dried over MgSO, and evaporated to give a residue (96 g). The residue was chromatographed on a 1.5 kg silica column using EtOAc/Hexane (1:1) containing 0.5% Et₃NH as the eluting solvent. The pure

product fractions were evaporated to give 90 g (90%) of the title compound.

N4-Benzoyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5-methylcytidine-3'-amidite

5 N4-Benzoyl-2'-O-methoxyethyl-5'-O-dimethoxytrityl-5methylcytidine (74 g, 0.10 M) was dissolved in CH,Cl, (1 L). Tetrazole diisopropylamine (7.1 g) and 2-cyanoethoxy-tetra-(isopropyl)phosphite (40.5 mL, 0.123 M) were added with stirring, under a nitrogen atmosphere. The resulting mixture 10 was stirred for 20 hours at room temperature (tlc showed the reaction to be 95% complete). The reaction mixture was extracted with saturated NaHCO3 (1x300 mL) and saturated NaCl (3x300 mL). The aqueous washes were back-extracted with CH2Cl2 (300 mL), and the extracts were combined, dried over $MgSO_4$ and 15 concentrated. The residue obtained was chromatographed on a 1.5 kg silica column using EtOAc/Hexane (3:1) as the eluting The pure fractions were combined to give 90.6 g (87%) of the title compound.

2'-(Aminooxyethyl) nucleoside amidites and 2'(dimethylaminooxyethyl) nucleoside amidites

Aminooxyethyl and dimethylaminooxyethyl amidites are prepared as per the methods of United States patent applications serial number 10/037,143, filed February 14, 1998, and serial number 09/016,520, filed January 30, 1998, each of which is commonly owned with the instant application and is herein incorporated by reference.

Example 2

20

Oligonucleotide synthesis

Unsubstituted and substituted phosphodiester (P=O) 30 oligonucleotides are synthesized on an automated DNA

synthesizer (Applied Biosystems model 380B) using standard phosphoramidite chemistry with oxidation by iodine.

Phosphorothicates (P=S) are synthesized as for the phosphodiester oligonucleotides except the standard oxidation 5 bottle was replaced by 0.2 M solution of 3H-1,2-benzodithicle-3-one 1,1-dioxide in acetonitrile for the stepwise thiation of the phosphite linkages. The thiation wait step was increased to 68 sec and was followed by the capping step. After cleavage from the CPG column and deblocking in concentrated ammonium hydroxide at 55°C (18 hours), the oligonucleotides were purified by precipitating twice with 2.5 volumes of ethanol from a 0.5 M NaCl solution. Phosphinate oligonucleotides are prepared as described in U.S. Patent 5,508,270, herein incorporated by reference.

Alkyl phosphonate oligonucleotides are prepared as described in U.S. Patent 4,469,863, herein incorporated by reference.

3'-Deoxy-3'-methylene phosphonate oligonucleotides are prepared as described in U.S. Patents 5,610,289 or 5,625,050, herein incorporated by reference.

Phosphoramidite oligonucleotides are prepared as described in U.S. Patent, 5,256,775 or U.S. Patent 5,366,878, herein incorporated by reference.

Alkylphosphonothioate oligonucleotides are prepared as described in published PCT applications PCT/US94/00902 and PCT/US93/06976 (published as WO 94/17093 and WO 94/02499, respectively), herein incorporated by reference.

3'-Deoxy-3'-amino phosphoramidate oligonucleotides are prepared as described in U.S. Patent 5,476,925, herein incorporated by reference.

Phosphotriester oligonucleotides are prepared as described in U.S. Patent 5,023,243, herein incorporated by reference.

38

Borano phosphate oligonucleotides are prepared as described in U.S. Patents 5,130,302 and 5,177,198, both herein incorporated by reference.

Example 3

5 Oligonucleoside synthesis

Methylenemethylimino linked oligonucleosides, identified as MMI linked oligonucleosides, methylenedimethylhydrazo linked oligonucleosides, also identified as MDH linked oligonucleosides, and methylenecarbonylamino linked 10 oligonucleosides, also identified as amide-3 linked oligonucleosides, and methyleneaminocarbonyl linked oligonucleosides, also identified as amide-4 linked oligonucleosides, as well as mixed backbone compounds having, for instance, alternating MMI and P=O or P=S linkages are prepared 15 as described in U.S. Patents 5,378,825, 5,386,023, 5,489,677, 5,602,240 and 5,610,289, all of which are herein incorporated by reference.

Formacetal and thioformacetal linked oligonucleosides are prepared as described in U.S. Patents 5,264,562 and 20 5,264,564, herein incorporated by reference.

Ethylene oxide linked oligonucleosides are prepared as described in U.S. Patent 5,223,618, herein incorporated by reference.

Example 4

25 PNA synthesis

reference.

Peptide nucleic acids (PNAs) are prepared in accordance with any of the various procedures referred to in Peptide Nucleic Acids (PNA): Synthesis, Properties and Potential Applications, Bioorganic & Medicinal Chemistry, 1996, 4, 5-23.

They may also be prepared in accordance with U.S. Patents 5,539,082, 5,700,922, and 5,719,262, herein incorporated by

Example 5

15

Synthesis of chimeric oligonucleotides

Chimeric oligonucleotides, oligonucleosides or mixed oligonucleotides/oligonucleosides of the invention can be of several different types. These include a first type wherein the "gap" segment of linked nucleosides is positioned between 5' and 3' "wing" segments of linked nucleosides and a second "open end" type wherein the "gap" segment is located at either the 3' or the 5' terminus of the oligomeric compound. Oligonucleotides of the first type are also known in the art as "gapmers" or gapped oligonucleotides. Oligonucleotides of the second type are also known in the art as "hemimers" or "wingmers".

[2'-0-Me] - [2'-deoxy] - [2'-0-Me] chimeric phosphorothioate oligonucleotides

having 2'-0-alkyl oligonucleotides Chimeric phosphorothioate and 2'-deoxy phosphorothioate oligonucleotide segments are synthesized using an Applied Biosystems automated DNA synthesizer Model 380B, as above. Oligonucleotides are 20 synthesized using the automated synthesizer and 2'-deoxy-5'dimethoxytrityl-3'-O-phosphoramidite for the DNA portion and 5'-dimethoxytrityl-2'-O-methyl-3'-O-phosphoramidite for 5' and The standard synthesis cycle is modified by increasing the wait step after the delivery of tetrazole and 25 base to 600 s repeated four times for RNA and twice for 2'-Omethyl. The fully protected oligonucleotide is cleaved from the support and the phosphate group is deprotected in 3:1 Ammonia/Ethanol at room temperature overnight then lyophilized to dryness. Treatment in methanolic ammonia for 24 hours at 30 room temperature is then done to deprotect all bases and sample was again lyophilized to dryness. The pellet is resuspended in 1M TBAF in THF for 24 hours at room temperature to deprotect the 2' positions. The reaction is then quenched with 1M TEAA and the sample is then reduced to 1/2 volume by

15

WO 01/57059 PCT/US01/02939

40

rotovac before being desalted on a G25 size exclusion column. The oligo recovered is then analyzed spectrophotometrically for yield and for purity by capillary electrophoresis and by mass spectrometry.

[2'-0-(2-Methoxyethyl)]-[2'-deoxy]-[2'-0-(Methoxyethyl)] chimeric phosphorothioate oligonucleotides

[2'-0-(2-methoxyethyl)]-[2'-deoxy]-[-2'-0-(methoxyethyl)] chimeric phosphorothicate oligonucleotides were prepared as per the procedure above for the 2'-0-methyl chimeric oligonucleotide, with the substitution of 2'-0-(methoxyethyl) amidites for the 2'-0-methyl amidites.

[2'-0-(2-Methoxyethyl)Phosphodiester]-[2'-deoxyPhosphorothioate]-[2'-0-(2-Methoxyethyl)Phosphodiester]chimeric oligonucleotides

[2'-O-(2-methoxyethyl phosphodiester]-[2'-deoxy phosphorothioate]-[2'-O-(methoxyethyl) phosphodiester] chimeric oligonucleotides are prepared as per the above procedure for the 2'-O-methyl chimeric oligonucleotide with the substitution of 2'-O-(methoxyethyl) amidites for the 2'-O-methyl amidites, oxidization with iodine to generate the phosphodiester internucleotide linkages within the wing portions of the chimeric structures and sulfurization utilizing 3,H-1,2 benzodithiole-3-one 1,1 dioxide (Beaucage Reagent) to generate the phosphorothioate internucleotide linkages for the center gap.

Other chimeric oligonucleotides, chimeric oligonucleosides and mixed chimeric oligonucleotides/oligonucleosides are synthesized according to U. S. Patent 5,623,065, herein incorporated by reference.

Example 6

Oligonucleotide isolation

After cleavage from the controlled pore glass column (Applied Biosystems) and deblocking in concentrated ammonium 5 hydroxide at 55°C for 18 hours, the oligonucleotides or oligonucleosides are purified by precipitation twice out of NaCl with 2.5 volumes ethanol. Synthesized polyacrylamide oligonucleotides were analyzed by electrophoresis on denaturing gels and judged to be at least The relative length material. full phosphorothicate and phosphodiester linkages obtained in synthesis were periodically checked by 31P nuclear magnetic resonance spectroscopy, and for some studies oligonucleotides were purified by HPLC, as described by Chiang et al., J. Biol. 15 Chem. 1991, 266, 18162-18171. Results obtained with HPLCpurified material were similar to those obtained with non-HPLC purified material.

Example 7

Oligonucleotide synthesis - 96 well plate format

Oligonucleotides were synthesized via solid phase P(III) 20 phosphoramidite chemistry on an automated synthesizer capable of assembling 96 sequences simultaneously in a standard 96 Phosphodiester internucleotide linkages were well format. afforded by oxidation with aqueous iodine. Phosphorothioate 25 internucleotide linkages were generated by sulfurization utilizing 3,H-1,2 benzodithiole-3-one 1,1 dioxide (Beaucage Reagent) in anhydrous acetonitrile. Standard base-protected beta-cyanoethyldiisopropyl phosphoramidites were purchased from commercial vendors (e.g. PE-Applied Biosystems, Foster 30 City, CA, or Pharmacia, Piscataway, NJ). Non-standard nucleosides are synthesized as per known literature or patented methods. They are utilized as base protected betacyanoethyldiisopropyl phosphoramidites.

Oligonucleotides were cleaved from support and deprotected with concentrated NH₄OH at elevated temperature (55-60°C) for 12-16 hours and the released product then dried in vacuo. The dried product was then re-suspended in sterile water to afford a master plate from which all analytical and test plate samples are then diluted utilizing robotic pipettors.

Example 8

Oligonucleotide analysis - 96 well plate format

The concentration of oligonucleotide in each well was 10 samples and UV dilution of absorption assessed by The full-length integrity of the individual spectroscopy. products was evaluated by capillary electrophoresis (CE) in either the 96 well format (Beckman P/ACE™ MDQ) or, for 15 individually prepared samples, on a commercial CE apparatus (e.g., Beckman P/ACE™ 5000, ABI 270). Base and backbone composition was confirmed by mass analysis of the compounds utilizing electrospray-mass spectroscopy. All assay test plates were diluted from the master plate using single and 20 multi-channel robotic pipettors. Plates were judged to be acceptable if at least 85% of the compounds on the plate were at least 85% full length.

Example 9

Cell culture and oligonucleotide treatment

25 The effect of antisense compounds on target nucleic acid expression can be tested in any of a variety of cell types provided that the target nucleic acid is present at measurable levels. This can be routinely determined using, for example, PCR or Northern blot analysis. The following four cell types are provided for illustrative purposes, but other cell types can be routinely used.

T-24 cells:

WO 01/57059

The transitional cell bladder carcinoma cell line T-24 was obtained from the American Type Culture Collection (ATCC) (Manassas, VA). T-24 cells were routinely cultured in complete McCoy's 5A basal media (Gibco/Life Technologies, Gaithersburg, MD) supplemented with 10% fetal calf serum (Gibco/Life Technologies, Gaithersburg, MD), penicillin 100 units per mL, and streptomycin 100 micrograms per mL (Gibco/Life Technologies, Gaithersburg, MD). Cells were routinely passaged by trypsinization and dilution when they reached 90% confluence. Cells were seeded into 96-well plates (Falcon-Primaria #3872) at a density of 7000 cells/well for use in RT-PCR analysis.

For Northern blotting or other analysis, cells may be seeded onto 100 mm or other standard tissue culture plates and treated similarly, using appropriate volumes of medium and oligonucleotide.

A549 cells:

The human lung carcinoma cell line A549 was obtained from the American Type Culture Collection (ATCC) (Manassas, VA). A549 cells were routinely cultured in DMEM basal media (Gibco/Life Technologies, Gaithersburg, MD) supplemented with 10% fetal calf serum (Gibco/Life Technologies, Gaithersburg, MD), penicillin 100 units per mL, and streptomycin 100 micrograms per mL (Gibco/Life Technologies, Gaithersburg, MD). Cells were routinely passaged by trypsinization and dilution when they reached 90% confluence.

NHDF cells:

Human neonatal dermal fibroblast (NHDF) were obtained 30 from the Clonetics Corporation (Walkersville MD). NHDFs were routinely maintained in Fibroblast Growth Medium (Clonetics Corporation, Walkersville MD) supplemented as recommended by

PCT/US01/02939

the supplier. Cells were maintained for up to 10 passages as recommended by the supplier.

HEK cells:

Human embryonic keratinocytes (HEK) were obtained from 5 the Clonetics Corporation (Walkersville MD). HEKs were routinely maintained in Keratinocyte Growth Medium (Clonetics Corporation, Walkersville MD) formulated as recommended by the supplier. Cells were routinely maintained for up to 10 passages as recommended by the supplier.

10 3T3-L1 cells:

The mouse embryonic adipocyte-like cell line 3T3-L1 was obtained from the American Type Culure Collection (Manassas, 3T3-L1 cells were routinely cultured in DMEM, high glucose (Gibco/Life Technologies, Gaithersburg, fetal calf serum 15 supplemented with 10% (Gibco/Life Technologies, Gaithersburg, MD). Cells were routinely passaged by trypsinization and dilution when they reached 80% confluence. Cells were seeded into 96-well plates (Falcon-Primaria #3872) at a density of 4000 cells/well for use in RT-20 PCR analysis.

For Northern blotting or other analyses, cells may be seeded onto 100 mm or other standard tissue culture plates and treated similarly, using appropriate volumes of medium and oligonucleotide.

25 Treatment with antisense compounds:

When cells reached 80% confluency, they were treated with oligonucleotide. For cells grown in 96-well plates, wells were washed once with 200 μL OPTI-MEM™-1 reduced-serum medium (Gibco BRL) and then treated with 130 μL of OPTI-MEM™-1 containing 3.75 μg/mL LIPOFECTIN™ (Gibco BRL) and the desired oligonucleotide at a final concentration of 150 nM. After 4

hours of treatment, the medium was replaced with fresh medium. Cells were harvested 16 hours after oligonucleotide treatment.

The concentration of oligonucleotide used varies from cell line. To determine the line to 5 oligonucleotide concentration for a particular cell line, the cells are treated with a positive control oligonucleotide at For human cells the positive a range of concentrations. control oligonucleotide is ISIS 13920, TCCGTCATCGCTCCTCAGGG, SEQ ID NO: 1, a 2'-O-methoxyethyl gapmer (2'-O-methoxyethyls 10 shown in bold) with a phosphorothioate backbone which is targeted to human H-ras. For mouse or rat cells the positive control oligonucleotide is ISIS 15770, ATGCATTCTGCCCCCAAGGA, SEQ ID NO: 2, a 2'-O-methoxyethyl gapmer (2'-O-methoxyethyls shown in bold) with a phosphorothicate backbone which is 15 targeted to both mouse and rat c-raf. The concentration of positive control oligonucleotide that results in 80% inhibition of H-ras (for ISIS 13920) or c-raf (for ISIS 15770) mRNA is then utilized as the screening concentration for new oligonucleotides in subsequent experiments for that cell line. 20 If 80% inhibition is not achieved, the lowest concentration of positive control oligonucleotide that results in 60% inhibition of H-ras or c-raf mRNA is then utilized as the in subsequent concentration oligonucleotide screening experiments for that cell line. If 60% inhibition is not 25 achieved, that particular cell line is deemed as unsuitable for oligonucleotide transfection experiments.

Example 10

Analysis of oligonucleotide inhibition of Survivin expression

Antisense modulation of Survivin expression can be
30 assayed in a variety of ways known in the art. For example,
Survivin mRNA levels can be quantitated by, e.g., Northern
blot analysis, competitive polymerase chain reaction (PCR),

or real-time PCR (RT-PCR). Real-time quantitative PCR is presently preferred. RNA analysis can be performed on total cellular RNA or poly(A) + mRNA. Methods of RNA isolation are for example, Ausubel, F.M. et al., Current taught in, 5 Protocols in Molecular Biology, Volume 1, pp. 4.1.1-4.2.9 and 4.5.1-4.5.3, John Wiley & Sons, Inc., 1993. Northern blot analysis is routine in the art and is taught in, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 1, pp. 4.2.1-4.2.9, John Wiley & Sons, Inc., 1996. 10 Real-time quantitative (PCR) can be conveniently accomplished using the commercially available ABI PRISM™ 7700 Sequence Detection System, available from PE-Applied Biosystems, Foster City, CA and used according to manufacturer's instructions. Other methods of PCR are also known in the art.

15 Survivin protein levels can be quantitated in a variety of ways well known in the art, such as immunoprecipitation, Western blot analysis (immunoblotting), ELISA or fluorescenceactivated cell sorting (FACS). Antibodies directed to Survivin can be identified and obtained from a variety of 20 sources, such as the MSRS catalog of antibodies (Aerie Corporation, Birmingham, MI), or can be prepared conventional antibody generation methods. Methods for preparation of polyclonal antisera are taught in, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, 25 Volume 2, pp. 11.12.1-11.12.9, John Wiley & Sons, Inc., 1997. Preparation of monoclonal antibodies is taught in, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 2, pp. 11.4.1-11.11.5, John Wiley & Sons, Inc., 1997.

Immunoprecipitation methods are standard in the art and can be found at, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 2, pp. 10.16.1-10.16.11, John Wiley & Sons, Inc., 1998. Western blot (immunoblot) analysis is standard in the art and can be found

at, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 2, pp. 10.8.1-10.8.21, John Wiley & Sons, Inc., 1997. Enzyme-linked immunosorbent assays (ELISA) are standard in the art and can be found at, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 2, pp. 11.2.1-11.2.22, John Wiley & Sons, Inc., 1991.

Example 11

Poly(A) + mRNA isolation

Poly(A) + mRNA was isolated according to Miura et al., 10 Clin. Chem., 1996, 42, 1758-1764. Other methods for poly(A)+ mRNA isolation are taught in, for example, Ausubel, F.M. et al., Current Protocols in Molecular Biology, Volume 1, pp. 4.5.1-4.5.3, John Wiley & Sons, Inc., 1993. Briefly, for 15 cells grown on 96-well plates, growth medium was removed from the cells and each well was washed with 200 μL cold PBS. 60 μL lysis buffer (10 mM Tris-HCl, pH 7.6, 1 mM EDTA, 0.5 M NaCl, 0.5% NP-40, 20 mM vanadyl-ribonucleoside complex) was added to each well, the plate was gently agitated and then 20 incubated at room temperature for five minutes. 55 μL of lysate was transferred to Oligo d(T) coated 96-well plates (AGCT Inc., Irvine CA). Plates were incubated for 60 minutes at room temperature, washed 3 times with 200 μL of wash buffer (10 mM Tris-HCl pH 7.6, 1 mM EDTA, 0.3 M NaCl). 25 final wash, the plate was blotted on paper towels to remove excess wash buffer and then air-dried for 5 minutes. 60 μL of elution buffer (5 mM Tris-HCl pH 7.6), preheated to 70°C was added to each well, the plate was incubated on a 90°C hot plate for 5 minutes, and the eluate was then transferred to 30 a fresh 96-well plate.

Cells grown on 100 mm or other standard plates may be treated similarly, using appropriate volumes of all solutions.

Example 12

Total RNA isolation

Total mRNA was isolated using an RNEASY 96™ kit and buffers purchased from Qiagen Inc. (Valencia CA) following the 5 manufacturer's recommended procedures. Briefly, for cells grown on 96-well plates, growth medium was removed from the cells and each well was washed with 200 μL cold PBS. 100 μL Buffer RLT was added to each well and the plate vigorously agitated for 20 seconds. 100 μL of 70% ethanol was then added 10 to each well and the contents mixed by pippeting three times up and down. The samples were then transferred to the RNEASY 96™ well plate attached to a QIAVAC™ manifold fitted with a waste collection tray and attached to a vacuum source. Vacuum was applied for 15 seconds. 1 mL of Buffer RW1 was added to 15 each well of the RNEASY 96™ plate and the vacuum again applied for 15 seconds. 1 mL of Buffer RPE was then added to each well of the RNEASY 96™ plate and the vacuum applied for a period of 15 seconds. The Buffer RPE wash was then repeated and the vacuum was applied for an additional 10 minutes. 20 plate was then removed from the QIAVAC™ manifold and blotted dry on paper towels. The plate was then re-attached to the QIAVAC™ manifold fitted with a collection tube rack containing 1.2 mL collection tubes. RNA was then eluted by pipetting 60 μL water into each well, incubating 1 minute, and then 25 applying the vacuum for 30 seconds. The elution step was repeated with an additional 60 μ L water.

Example 13

Real-time quantitative PCR analysis of Survivin mRNA levels

Quantitation of Survivin mRNA levels was determined by real-time quantitative PCR using the ABI PRISM™ 7700 Sequence Detection System (PE-Applied Biosystems, Foster City, CA) according to manufacturer's instructions. This is a closed-tube, non-gel-based, fluorescence detection system which

allows high-throughput quantitation of polymerase chain reaction (PCR) products in real-time. As opposed to standard PCR, in which amplification products are quantitated after the PCR is completed, products in real-time quantitative PCR are This is accomplished by 5 quantitated as they accumulate. including in the PCR reaction an oligonucleotide probe that anneals specifically between the forward and reverse PCR primers, and contains two fluorescent dyes. A reporter dye (e.g., JOE or FAM, obtained from either Operon Technologies 10 Inc., Alameda, CA or PE-Applied Biosystems, Foster City, CA) is attached to the 5' end of the probe and a quencher dye (e.g., TAMRA, obtained from either Operon Technologies Inc., Alameda, CA or PE-Applied Biosystems, Foster City, CA) is attached to the 3' end of the probe. When the probe and dyes 15 are intact, reporter dye emission is quenched by the proximity of the 3' quencher dye. During amplification, annealing of the probe to the target sequence creates a substrate that can be cleaved by the 5'-exonuclease activity of Taq polymerase. During the extension phase of the PCR amplification cycle, 20 cleavage of the probe by Taq polymerase releases the reporter dye from the remainder of the probe (and hence from the quencher moiety) and a sequence-specific fluorescent signal With each cycle, additional reporter dye is generated. molecules are cleaved from their respective probes, and the 25 fluorescence intensity is monitored at regular (six-second) intervals by laser optics built into the ABI PRISM™ 7700 In each assay, a series of Sequence Detection System. parallel reactions containing serial dilutions of mRNA from untreated control samples generates a standard curve that is 30 used to quantitate the percent inhibition after antisense oligonucleotide treatment of test samples.

PCR reagents were obtained from PE-Applied Biosystems, Foster City, CA. RT-PCR reactions were carried out by adding 25 µL PCR cocktail (1x TAQMAN™ buffer A, 5.5 mM MgCl₂, 300 µM 35 each of dATP, dCTP and dGTP, 600 µM of dUTP, 100 nM each of

forward primer, reverse primer, and probe, 20 Units RNAse inhibitor, 1.25 Units AMPLITAQ GOLD™, and 12.5 Units MuLV reverse transcriptase) to 96 well plates containing 25 µL poly(A) mRNA solution. The RT reaction was carried out by incubation for 30 minutes at 48°C. Following a 10 minute incubation at 95°C to activate the AMPLITAQ GOLD™, 40 cycles of a two-step PCR protocol were carried out: 95°C for 15 seconds (denaturation) followed by 60°C for 1.5 minutes (annealing/extension). Probes and primers to human Survivin were designed to hybridize to a human Survivin sequence, using published sequence information (GenBank accession number U75285, incorporated herein as SEQ ID NO:3). For human Survivin the PCR primers were:

forward primer: AAGGACCACCGCATCTCTACA (SEQ ID NO: 4)

15 reverse primer: CCAAGTCTGGCTCGTTCTCAGT (SEQ ID NO: 5) and the PCR probe was: FAM-CGAGGCTGGCTTCATCCACTGCC-TAMRA (SEQ ID NO: 6) where FAM (PE-Applied Biosystems, Foster City, CA) is the fluorescent reporter dye) and TAMRA (PE-Applied Biosystems, Foster City, CA) is the quencher dye. For human CAPDH the PCR primers were:

forward primer: GAAGGTGAAGGTCGGAGTC (SEQ ID NO: 7)
reverse primer: GAAGATGGTGATGGGATTTC (SEQ ID NO: 8) and the
PCR probe was: 5' JOE-CAAGCTTCCCGTTCTCAGCC- TAMRA 3' (SEQ ID
NO: 9) where JOE (PE-Applied Biosystems, Foster City, CA) is
the fluorescent reporter dye) and TAMRA (PE-Applied
Biosystems, Foster City, CA) is the quencher dye.

Probes and primers to mouse Survivin were designed to hybridize to a mouse Survivin sequence, using published sequence information (GenBank accession number AB013819, 30 incorporated herein as SEQ ID NO:10). For mouse Survivin the PCR primers were:

forward primer: CCGAGAACGAGCCTGATTTG (SEQ ID NO:11) reverse primer: GGGAGTGCTTTCTATGCTCCTCTA (SEQ ID NO: 12) and the PCR probe was: FAM-TAAGGAATTGGAAGGCTGGGAACCCG-TAMRA

(SEQ ID NO: 13) where FAM (PE-Applied Biosystems, Foster City, CA) is the fluorescent reporter dye) and TAMRA (PE-Applied Biosystems, Foster City, CA) is the quencher dye. For mouse GAPDH the PCR primers were:

forward primer: GGCAAATTCAACGGCACAGT (SEQ ID NO: 14)
reverse primer: GGGTCTCGCTCCTGGAAGCT (SEQ ID NO: 15) and the
PCR probe was: 5' JOE-AAGGCCGAGAATGGGAAGCTTGTCATC- TAMRA 3'
(SEQ ID NO: 16) where JOE (PE-Applied Biosystems, Foster City,
CA) is the fluorescent reporter dye) and TAMRA (PE-Applied
Biosystems, Foster City, CA) is the quencher dye.

Example 14

Northern blot analysis of Survivin mRNA levels

treatment, Eighteen hours after antisense 15 monolayers were washed twice with cold PBS and lysed in 1 mL RNAZOL™ (TEL-TEST "B" Inc., Friendswood, TX). Total RNA was prepared following manufacturer's recommended protocols. fractionated by RNA was Twenty micrograms of total electrophoresis through 1.2% agarose gels containing 1.1% 20 formaldehyde using a MOPS buffer system (AMRESCO, Inc. Solon, RNA was transferred from the gel to $\mathtt{HYBOND^{1M}-N+}$ nylon membranes (Amersham Pharmacia Biotech, Piscataway, NJ) by overnight capillary transfer using a Northern/Southern Transfer buffer system (TEL-TEST "B" Inc., Friendswood, TX). 25 RNA transfer was confirmed by UV visualization. STRATALINKER™ UV were fixed by UV cross-linking using a Crosslinker 2400 (Stratagene, Inc, La Jolla, CA) and then robed using QUICKHYB™ hybridization solution (Stratagene, La Jolla, CA) using manufacturer's recommendations for stringent 30 conditions.

To detect human Survivin, a human Survivin specific probe was prepared by PCR using the forward primer AAGGACCACCGCATCTCTACA (SEQ ID NO: 4) and the reverse primer CCAAGTCTGGCTCGTTCTCAGT (SEQ ID NO: 5). To normalize for

variations in loading and transfer efficiency membranes were stripped and probed for human glyceraldehyde-3-phosphate dehydrogenase (GAPDH) RNA (Clontech, Palo Alto, CA).

To detect mouse Survivin, a mouse Survivin specific probe was prepared by PCR using the forward primer CCGAGAACGAGCCTGATTTG (SEQ ID NO:11) and the reverse primer GGGAGTGCTTTCTATGCTCCTCTA (SEQ ID NO: 12). To normalize for variations in loading and transfer efficiency membranes were stripped and probed for mouse glyceraldehyde-3-phosphate dehydrogenase (GAPDH) RNA (Clontech, Palo Alto, CA).

Example 15

Antisense inhibition of Survivin expression- phosphorothioate oligodeoxynucleotides

In accordance with the present invention, a series of 15 oligonucleotides were designed to target different regions of the human Survivin RNA, using published sequences (GenBank accession number U75285, incorporated herein as SEQ ID NO: 3). The oligonucleotides are shown in Table 1. Target sites are indicated by nucleotide numbers, as given in the sequence 20 source reference (Genbank accession no. U75285), to which the All compounds in Table 1 are oligonucleotide binds. phosphorothioate backbones oligodeoxynucleotides with (internucleoside linkages) throughout. All cytodines are 5methylcytidines. The compounds were analyzed for effect on 25 Survivin mRNA levels by quantitative real-time PCR as described in other examples herein. Data are averages from three experiments. If present, "N.D." indicates "no data".

Example 16

5

10 Antisense inhibition of Survivin expression- phosphorothioate 2'-MOE gapmer oligonucleotides

In accordance with the present invention, a second series of oligonucleotides targeted to human Survivin were synthesized. The oligonucleotide sequences are shown in Table 2. Target sites are indicated by nucleotide numbers, as given in the sequence source reference (Genbank accession no. U75285), to which the oligonucleotide binds.

All compounds in Table 2 are chimeric oligonucleotides ("gapmers") 18 nucleotides in length, composed of a central 20 "gap" region consisting of ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by four-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothicate (P=S) throughout the oligonucleotide. 25 All cytidine residues are 5-methylcytidines.

Data were obtained by real-time quantitative PCR as described in other examples herein and are averaged from three experiments. If present, "N.D." indicates "no data".

As shown in Table 2, SEQ ID NOs 60, 65, 68, 70, 72, 76, 80, 83, 87, 88, 91 and 92 demonstrated at least 30% inhibition of Survivin expression in this experiment and are therefore preferred.

10 Example 17

Antisense inhibition of Survivin expression- phosphorothioate 2'-MOE gapmer oligonucleotides

In accordance with the present invention, a third series of oligonucleotides targeted to human Survivin mRNA were synthesized. The oligonucleotide sequences are shown in Table 3. Target sites are indicated by nucleotide numbers to which the oligonucleotide binds. The human Survivin mRNA was generated by splicing nucleotides 2811-2921, 3174-3283, 5158-5275 and 11955-12044 from Genbank accession no. U75285 creating the complete human mRNA sequence herein incorporated as SEQ ID NO: 97.

All compounds in Table 3 are chimeric oligonucleotides ("gapmers") 18 nucleotides in length, composed of a central "gap" region consisting of ten 2'-deoxynucleotides, which is 25 flanked on both sides (5' and 3' directions) by four-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines.

Data were obtained by real-time quantitative PCR as described in other examples herein and are averaged from three experiments. If present, "N.D." indicates "no data".

As shown in Table 3, SEQ ID Nos 101, 106, 107, 113, 138, 141, 152 and 156 demonstrated at least 30% inhibition of human Survivin expression in this assay and are therefore preferred.

Example 18

Antisense inhibition of mouse Survivin expression by chimeric phosphorothicate oligonucleotides having 2'-MOE wings and a deoxy gap.

In accordance with the present invention, a series of oligonucleotides were designed to target different regions of the mouse Survivin RNA, using published sequences (GenBank accession number AB013819, incorporated herein as 15 SEQ ID NO: 10). The oligonucleotides are shown in Table 4. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide binds. All compounds in Table 4 are chimeric oligonucleotides ("gapmers") 20 nucleotides in 20 length, composed of a central "gap" region consisting of ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE) nucleotides. internucleoside (backbone) linkages are phosphorothioate 25 (P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines. The compounds were analyzed for their effect on mouse Survivin mRNA levels by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments. Ιf 30 present, "N.D." indicates "no data".

As shown in Table 4, SEQ ID NOs 187, 188, 192, 193, 196, 197, 198, 199, 202, 205, 207, 208, 211, 212, 213, 214, 218, 219, 225, 226, 228 and 229 demonstrated at least 30% inhibition of mouse Survivin expression in this experiment and are therefore preferred.

In accordance with the present invention, a second series of oligonucleotides were designed to target different regions of the mouse Survivin RNA, using published sequences (GenBank accession number AA717921, incorporated herein as SEQ ID NO: 231). The oligonucleotides are shown in Table 5. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide

62

binds. All compounds in Table 5 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE) nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines. The compounds were analyzed for their effect on mouse Survivin mRNA levels by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments. If present, "N.D." indicates "no data".

Table 5

Inhibition of mouse Survivin mRNA levels by chimeric phosphorothicate oligonucleotides having 2'-MOE wings and a deoxy gap

As shown in Table 5, SEQ ID NOs 237 and 247 demonstrated at least 30% inhibition of mouse Survivin expression in this experiment and are therefore preferred.

Example 19

5 Western blot analysis of Survivin protein levels

Western blot analysis (immunoblot analysis) is carried out using standard methods. Cells are harvested 16-20 hours after oligonucleotide treatment, washed once with PBS, suspended in Laemmli buffer (100 μl/well), boiled for 5 minutes and loaded on a 16% SDS-PAGE gel. Gels are run for 1.5 hours at 150 V, and transferred to membrane for western blotting. Appropriate primary antibody directed to Survivin is used, with a radiolabelled or fluorescently labeled secondary antibody directed against the primary antibody species. Bands are visualized using a PHOSPHORIMAGER™ (Molecular Dynamics, Sunnyvale CA).

Example 20

Effect of antisense inhibition of Survivin on apoptosis

mismatch 28598 control, ISIS 23722 and a 20 (TAAGCTGTTCTATGTGTT; SEQ ID NO: 248) were assayed for their effect on apoptosis in HeLa cells. The caspase inhibitor z-VAD.fmk was purchased from Calbiochem (La Jolla CA) and used according to manufacturer's recommendations. In HeLa cells without oligonucleotide, approximately 4% of cells are 25 hypodiploid (indicating DNA fragmentation, a measure of apoptosis). With the addition of ISIS 23722, approximately 22% of cells are hypodiploid, compared to approximately 11% with the mismatch oligonucleotide. In the presence of the caspase inhibitor z-VAD.fmk (42.8 mM), the percent of hypodiploid 30 (apoptotic) cells drops to 3% without oligonucleotide, 6% with ISIS 23722 and 4% with the mismatch control. This demonstrates

64

that antisense inhibition of Survivin increases apoptosis and that this effect is caspase-mediated.

Example 21

Effect of antisense inhibition of Survivin on cytokinesis

HeLa cells treated with an antisense oligonucleotide targeted to Survivin (ISIS 23722) can be observed to form large, multinucleated cells as a result of improper cell division. The mismatch control oligonucleotide did not have this effect and cells appeared normal (comparable to untreated controls).

This effect can be quantitated by flow cytometry.

Untreated cells or cells treated with the control oligonucleotide display two prominent peaks, representing populations of cells in the G1 phase and the G2/M phase of 15 cell division, respectively. G1 cells have a single copy of their DNA (1x) and G2/M cells have two copies(2x). Over time from 24 hours to 72 hours, these 1x and 2x peaks remain virtually unchanged in cells treated with the control oligonucleotide or without oligonucleotide. However, in cells 20 treated with the antisense oligonucleotide targeted to Survivin, the majority of cells have two copies of DNA by 24 hours after oligo treatment. This indicates that cell division 48 hours after treatment with this arrested. By oligonucleotide, a 4x peak is approximately equal in size to 25 the 1x and 2x peaks, indicating roughly equal numbers of cells with one, two and four copies of DNA. By 72 hours the largest peak is 16x, indicating that cells have 16 copies of their DNA and thus that division of the cytoplasm has not occurred for multiple generations. Thus inhibition of Survivin is shown to 30 interfere with cytokinesis.

Example 22

Effect of antisense inhibition of Survivin on cell proliferation

Human HT1080 fibrosarcoma cells (American Type Culture 5 Collection, CCL-121) were grown in minimal essential medium with 1% non-essential amino acids, 90% with 10% fetal bovine serum (Gibco BRL). Cells were electroporated (Electro Square Experimental Model T820, Biotechnologies and Porator, Research, BTX) with oligonucleotide at settings of 225 volts 10 for 6 milliseconds with a single pulse and oligonucleotide concentrations of 1 to 30 μM . ISIS 23722 (SEQ ID NO: 87) and the mismatch control ISIS 28598 (SEQ ID NO: 248) were used. Cells were plated at 1500 cells/well immediately after electroporation and viable cells were measured by MTT assay 15 at 24, 48, 72, 96 and 120 hours after electroporation. Growth oligonucleotide against (\DOD/hour) was plotted concentration. At an oligonucleotide concentration of 1 μM , growth rates were virtually identical for ISIS 23722 and the control, ISIS 28598 (0.01726 and 0.01683, respectively. At 5 20 μM oligonucleotide, the growth rate of the ISIS 23722-treated cells was 16.7% less than the control treated cells (0.01433 vs. 0.01728 Δ OD/hour, respectively). At 10 μ M the growth rate of the ISIS 23722-treated cells was 45% less than the control treated cells (0.009677 vs. 0.01762 AOD/hour, respectively). 25 At 20 μM the growth rate of the ISIS 23722-treated cells was 52% less than the control treated cells (0.007716 vs. 0.01620 Δ OD/hour, respectively). At 30 μ M the growth rate of the ISIS 23722-treated cells was 54% less than the control treated cells (0.006562 vs. 0.01417 Δ OD/hour, respectively). Thus 30 treatment with antisense oligonucleotide targeted to Survivin demonstrated to reduce the rate of tumor cell proliferation by over 50%.

In an similar experiment using a different control oligonucleotide, a 20mer random oligonucleotide (ISIS 29848, 35 SEQ ID NO: 249; NNNNNNNNNNNNNNNNNNN, wherein each N is a

66

mixture of A, C, G and T) a similar result was obtained. Oligonucleotides were tested at concentrations of 0.5 to 20 μM , and cell viability was again measured by MTT assay and growth rate (ΔOD/hour) was calculated. 5 oligonucleotide concentrations, growth rates were similar for ISIS 23722 and control treated cells (0.01441 and 0.01342, respectively). At 10 μM the growth rate of the ISIS 23722treated cells was 57% less than the control treated cells $(0.005568 \text{ vs. } 0.01298 \text{ } \Delta\text{OD/hour, respectively})$. At 20 μM the ·10 growth rate of the ISIS 23722-treated cells was 77% less than the control treated cells (0.002433 vs. 0.01073 AOD/hour, respectively). Thus treatment with antisense oligonucleotide targeted to Survivin was demonstrated to reduce the rate of tumor cell proliferation by over 75% compared to control.

15 A similar experiment was conducted in human MCF-7 breast carcinoma cells, testing ISIS 23722 and the random control ISIS 29848 at doses from 0.5 to 20 μ M. Cells were Porator, Model T820 electroporated (Electro Square manufactured by Biotechnologies and Experimental Research, 20 BTX) at settings of 175 volts for 6 milliseconds with a single pulse with oligonucleotide and growth rates were calculated described above. Αt At . 0.5 μ M oligonucleotide as concentrations, growth rates were similar for ISIS 23722 and control treated cells (0.005959 and 0.005720, respectively). 25 At 1 μ M oligonucleotide, growth rates were still relatively similar for ISIS 23722 and control treated cells (0.005938 and 0.005479, respectively). At 5 μM oligonucleotide, growth rates were 0.002574 and 0.005676, respectively for ISIS 23722 and control treated cells. At 10 μM the growth rate of the 30 ISIS 23722-treated cells was 69% less than the control treated cells (0.001828 vs. 0.005901 AOD/hour, respectively). At 20 μM the growth rate of the ISIS 23722-treated cells was 64% less than the control treated cells (0.001523 vs. 0.004223 respectively). Thus treatment with antisense ΔOD/hour, 35 oligonucleotide targeted to Survivin was demonstrated to

significantly reduce the rate of tumor cell proliferation in several tumor cell types.

Example 23

Sensitization of cells to chemotherapeutic agent stimuli by 5 ISIS 23722

Human HT1080 fibrosarcoma cells (American Type Culture Collection, CCL-121) were grown in minimal essential medium with 1% non-essential amino acids, 90% with 10% fetal bovine 15 serum (Gibco BRL). Cells were treated with oligonucleotide at concentrations of 10 to 100 nM alone or in combination with (concentrations of 0.25 nM or 1nM) or Cisplatin (concentrations of 5 μM or 25 μM). Treatment with Taxol or Cisplatin followed oligonucleotide treatment by 1-2 hr. 20 were plated at 1500 cells/well immediately after treatment and viable cells were measured by MTT assay at 12, 24, 36, 48, and 60 hours after treatment. Growth rate (\DOD/hour) is plotted and/or chemotherapeutic against oligonucleotide concentration.

A similar experiment was conducted in human MCF-7 breast carcinoma cells (American Type Culture Collection), testing ISIS 23722 and the random control ISIS 29848 at doses from 10 to 100 nM alone or in combination with Taxol (concentrations of 0.5 nM or 2nM) or Cisplatin (concentrations of 2.5 μ M or 15 μ M). Cells were grown in Dulbecco's Modified Eagles medium (low glucose), 90% with 10% fetal bovine serum (Gibco BRL). Treatment with Taxol or Cisplatin followed oligonucleotide treatment by 1-2 hr. Cells were plated at 2500 cells/well immediately after transfection and viable cells were measured

68

by MTT assay at 12, 24, 36, 48, and 60 hours after treatment. Growth rate (Δ OD/hour) is plotted against oligonucleotide and/or chemotherapeutic agent concentration.

Example 24

5 Mixed backbone version of active oligonucleotide ISIS 23722

An oligonucleotide having the same sequence as ISIS 23722 (SEQ ID NO:87) was synthesized, this time as a 2' MOE gapmer with phosphodiester backbone linkages in the 2'MOE "wings" and phosphorothicate linkages in the 2'deoxy "gap". Both 10 cytosines are 5-methylcytosines.

This compound is tested for its effects on cell proliferation, cytokinesis and sensitization to chemotherapeutic agents as described herein in previous examples.

What is claimed is:

1. An antisense compound 8 to 30 nucleobases in length targeted to a nucleic acid molecule encoding human Survivin, wherein said antisense compound inhibits the expression of human Survivin.

5

- 2. The antisense compound of claim 1 which is an antisense oligonucleotide.
- 3. The antisense compound of claim 2 comprising at least an 8-nucleobase portion of SEQ ID NO: 19, 21, 23, 24, 25, 27, 29, 30, 32, 37, 40, 41, 43, 48, 49, 50, 51, 52, 56, 60, 65, 68, 70, 72, 76, 80, 83, 87, 88, 91, 92, 101, 106, 107, 113, 138, 141, 152 or 156.
- 4. The antisense compound of claim 3 comprising SEQ 15 ID NO: 25, 30, 40, 43, 48, 65, 70, 80, 83 or 88.
 - 5. The antisense compound of claim 2 which comprises at least one modified internucleoside linkage.
- 6. The antisense compound of claim 5 wherein the 20 modified internucleoside linkage is a phosphorothicate linkage.
 - 7. The antisense compound of claim 2 which comprises at least one modified sugar moiety.
- 8. The antisense compound of claim 7 wherein the 25 modified sugar moiety is a 2'-O-methoxyethyl sugar moiety.
 - 9. The antisense compound of claim 2 which comprises at least one modified nucleobase.

- 10. The antisense compound of claim 9 wherein the modified nucleobase is a 5-methylcytosine.
- 11. The antisense compound of claim 2 which is a chimeric oligonucleotide.
- 12. A composition comprising the antisense compound of5 claim 1 and a pharmaceutically acceptable carrier or diluent.
 - 13. The composition of claim 12 further comprising a colloidal dispersion system.
 - 14. The composition of claim 12 wherein the antisense compound is an antisense oligonucleotide.
- 10 15. A method of inhibiting the expression of Survivin in human cells or tissues comprising contacting human cells or tissues with the antisense compound of claim 1 so that expression of Survivin is inhibited.
- 16. A method of treating an animal having a disease or condition associated with Survivin comprising administering to an animal having a disease or condition associated with Survivin a therapeutically or prophylactically effective amount of the antisense compound of claim 1 so that expression of Survivin is inhibited.
- 20 17. The method of claim 16 wherein the disease or condition is a hyperproliferative condition.
 - 18. The method of claim 17 wherein the hyperproliferative condition is cancer.
- 19. A method of treating a human having a disease or 25 condition characterized by a reduction in apoptosis comprising

administering to a human having a disease or condition characterized by a reduction in apoptosis a prophylactically or therapeutically effective amount of the antisense compound of claim 1.

- 20. A method of modulating apoptosis in a cell 5 comprising contacting a cell with the antisense compound of claim 1 so that apoptosis is modulated.
 - 21. A method of modulating cytokinesis in a cell comprising contacting a cell with the antisense compound of claim 1 so that cytokinesis is modulated.
- 22. A method of modulating the cell cycle in a cell comprising contacting a cell with the antisense compound of claim 1 so that the cell cycle is modulated.
- 23. A method of inhibiting the proliferation of cells comprising contacting cells with an effective amount of the antisense compound of claim 1, so that proliferation of the cells is inhibited.
 - 24. The method of claim 23 wherein said cells are cancer cells.
- 20 25. The composition of claim 12 further comprising a chemotherapeutic agent.
 - 26. The method of claim 19 further comprising administering to the patient a chemotherapeutic agent.
- 27. The method of claim 20 wherein said modulation of apoptosis is sensitization to an apoptotic stimulus.

72

- 28. The method of claim 27 wherein said apoptotic stimulus is a cytotoxic chemotherapeutic agent.
- 29. The method of claim 23 further comprising contacting said cells with a chemotherapeutic agent.
- 30. The method of claim 29 wherein said 5 chemotherapeutic agent is taxol or cisplatin.

## INTERNATIONAL SEARCH REPORT

International application No. PCT/US01@2939

A. CLASSIFICATION OF SUBJECT MATTER  IPC(7) :C07H 21/04; A61K 48/00; C12N 15/09, 15/00; C12Q 1/68  US CL :435/6, 375, 455; 514/44; 536/23.1, 24.1, 24.5  According to International Patent Classification (IPC) or to both national classification and IPC  B. FIELDS SEARCHED  Minimum documentation searched (classification system followed by classification symbols)  U.S. : 435/6, 375, 455; 514/44; 536/23.1, 24.1, 24.5  Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched NONE				
Electronic data base consulted during the international search (n WEST, MEDLINE, BIOSIS, EMBASE, CAPLUS, BIOTEC		e, search terms used)		
C. DOCUMENTS CONSIDERED TO BE RELEVANT				
Category* Citation of document, with indication, where a	ppropriate, of the relevant passages	Relevant to claim No.		
Y WO 98/22589 A2 (YALE UNIVERSI document.	TY) 28 May 1998, see entire	1, 2, 5-15, 20  3, 4, 16-19, 21-30		
Further documents are listed in the continuation of Box				
A* document defining the general states of the art which is not considered to be of particular relevance.
